China, Hong Kong

REGISTRATION AREA

The Hong Kong Cancer Registry covers the Hong Kong Special Administrative Region of China. Hong Kong is one of the most densely populated places in the world, with an average density of 6540 residents/km^2. In 2011, the population was 7.1 million. About 92% of residents are Chinese, mostly descendants of people from Guangdong Province in southern China.

CANCER CARE FACILITIES

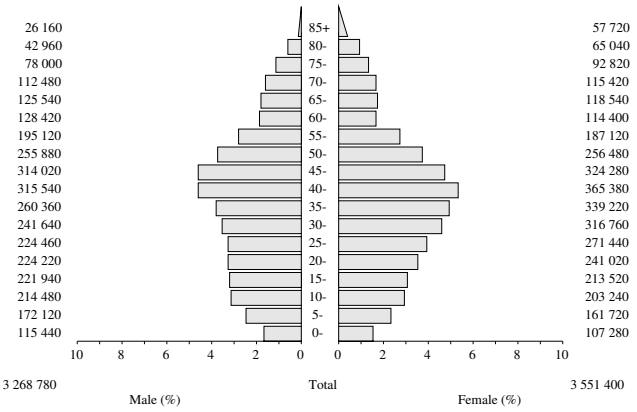
The Hospital Authority (HA) is a statutory body that manages all public hospitals and institutions in Hong Kong. There are six clinical oncology centres within the HA and a few private hospitals that provide clinical oncology services. At the end of 2011, Hong Kong had a total of 39 photon radiotherapy machines (in public and private hospitals). Most local patients are treated at public hospitals.

REGISTRY STRUCTURE AND METHODS

Cancer notification in Hong Kong is mandated by administrative order, without a specific law. The registry is staffed by seven employees, including statistical analysts and abstract clerks who carry out the registry's day-to-day activities. The director is a clinical oncologist, who provides regular input on the validity of the clinical data in addition to overseeing the registry's operation. The registry receives electronic data directly from all public hospitals, and has a good working relationship with most private cancer centres and pathology laboratories. Near-complete coverage has been achieved within the registration area. Death certificates are received from Hong Kong's Department of Health.

INTERPRETING THE RESULTS

A government cervical screening programme was initiated in March 2004.



USE OF THE DATA

The registry publishes annual reports on cancer incidence and mortality on its website. Basic descriptive epidemiological analyses are also included, and survival data on some cancers have been provided in recent years. Registry data are routinely used by officials, health professionals, cancer control groups, and the public. The data are also extensively used by local researchers for various epidemiological studies.

§Includes 17 cases of unknown age

§Includes 12 cases of unknown age

China, Jiashan County

REGISTRATION AREA

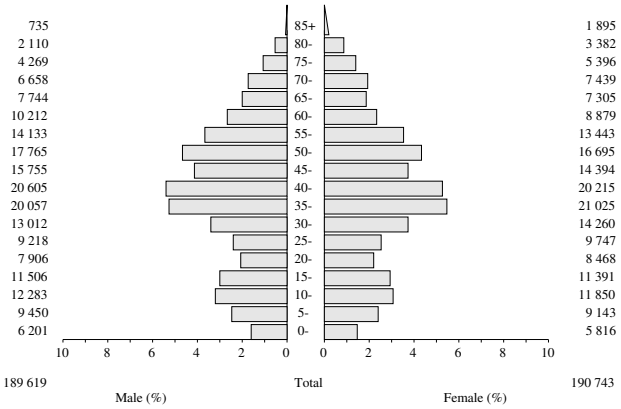
The Jiashan Cancer Registry covers Jiashan County, in the north of Zhejiang Province in China. The county has an area of about 506.6 km^2. In 2007, the population was 381 000 (nearly all Han Chinese). About 65% of residents live in rural areas. The population density is 752 residents/km^2. Agriculture is the major industry.

CANCER CARE FACILITIES

There are 19 medical establishments (hospitals and clinics), including three county-level hospitals that provide cancer surgery, chemotherapy, and integrated traditional and evidence-based medical services.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1987 to determine and report cancer incidence and mortality, as well as all-cause mortality. It is affiliated with the Jiashan County Cancer Research Institute. Hospitals and clinics are required by Jiashan County Health Bureau regulations to report all newly diagnosed cancers, as well as benign tumours of the central nervous system. Cause of death must be reported for all deaths due to disease. At the end of 2007, the registry's missing report rate was 3.1%. The registry uses the IARC/IACR rules for multiple primary tumours.



USE OF THE DATA

The registry publishes an annual report on cancer incidence and mortality. Data on cancer incidence, prevalence, and mortality by sex, age, and site are also used in cancer prevention and treatment and for research on cancer etiology.

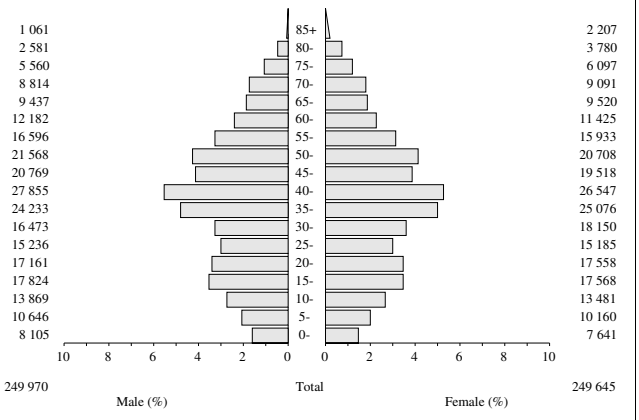
China, Jiaxing City

REGISTRATION AREA
The Jiaxing Cancer Registry covers Nanhu District in the prefecture-level city of Jiaxing in eastern China. Nanhu is one of the city's two urban districts, and the majority (99.5%) of its population is Han Chinese.

CANCER CARE FACILITIES
There are eight large public hospitals (two with radiotherapy facilities) and 15 community hospitals, all of which report new cancer cases and benign tumours of the brain and central nervous system, as well as all causes of death. Some patients are covered by government health insurance.



REGISTRY STRUCTURE AND METHODS
The registry was established in 1992. Clinicians are responsible for reporting new cancer cases. Public health physicians then check these reports and send the notification cards to the registry. Three senior registry staff members categorize and code the cases, and then the community physicians double-check the information and conduct follow-up as required. The Jiaxing Center for Disease Control and Prevention's cause of death reporting system is used to check for missing incident cases. All patient-related information is confidential. The registry reviews its data quality twice per year, and a sample-based investigation of missing cases is conducted every 3 years. The registry database was computerized in 1996. The registry adopted ICD-9 and ICD-10 coding in 2001. Since 2009, all cases have been reported directly to the registry through an online system. The registry uses the IARC/IACR rules (2000) for multiple primary tumours.

INTERPRETING THE RESULTS
Factors that might affect incidence rates include the availability and quality of diagnosis and treatment services, the quality of the hospital reporting systems (which have been greatly improved), the level of health awareness within the population (which has increased substantially since 1992), and the increasing coverage provided by national and local insurance policies.

USE OF THE DATA
Registry data are used mainly for surveillance and reporting of cancer incidence, analysis of survival rates, and planning and evaluation of health services.

China, Macao

REGISTRATION AREA

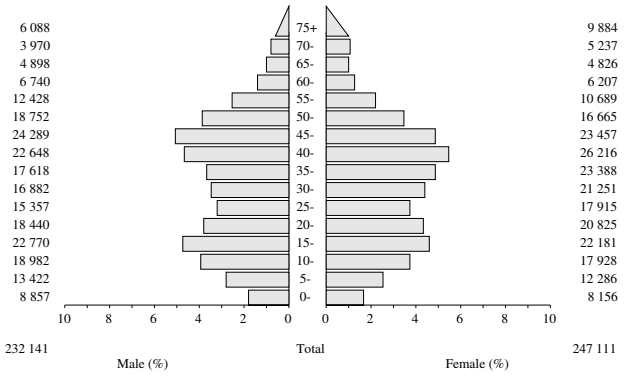
The Macao Cancer Registry covers the Macao Special Administrative Region of China, which has a total area of about 30 km^2 and consists of a peninsula and two islands that have been connected through land reclamation. Macao is bordered by the Pearl River Delta to the east, Guangdong Province to the north and west, and the South China Sea to the south. The population is about 500 000.

CANCER CARE FACILITIES

There is one major public hospital (Conde S. Januário Hospital) and two private hospitals (Kiang Wu Hospital and the Macau University of Science and Technology Hospital). All three are general hospitals. The public hospital provides free services for residents diagnosed with cancer. The government also subsidizes the Hospice and Palliative Care Centre of Kiang Wu Hospital, which began providing hospice care to patients with terminal illnesses in 2000. Macao has six health centres that provide free family medicine and community prevention services to residents.

REGISTRY STRUCTURE AND METHODS

The registry's primary source of information is reports submitted by physicians and pathologists (mainly those working at local hospitals that provide pathological diagnosis and cancer care) directly to the management unit of the registry within Macao's Health Bureau. For the purpose of annual analyses, information on cancer deaths is also registered from death certificates. The reports from various sources are collated and checked for duplicates. Case verification and data validation are performed to ensure data quality.



USE OF THE DATA

The registry provides information on the general cancer situation and trends in Macao. Registry data are analysed to generate annual summary statistics (including incidence, mortality, and survival), which are provided to policy-makers, academics, and the general public. The registry publishes an annual report in print and online. The registry also provides additional anonymized data to researchers and policy-makers. A report on cancer survival was published in 2010.

§Includes 5 cases of unknown age

§Includes 3 cases of unknown age

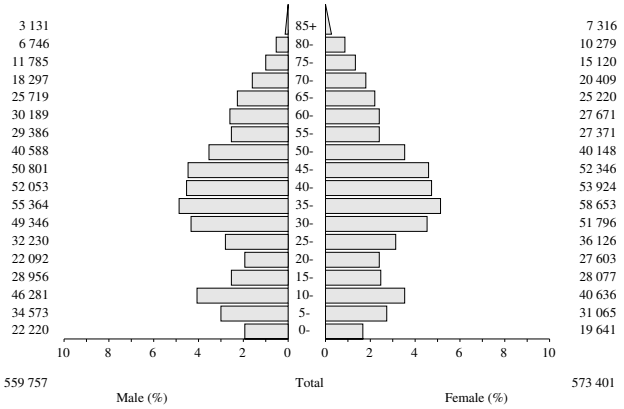
China, Qidong County

REGISTRATION AREA

The Qidong Cancer Registry covers the county-level city of Qidong in Jiangsu Province in China. Qidong is located on the banks of the Yellow Sea at the mouth of the Yangtze River, to the north of Shanghai. It has six districts (Huilong, Qixi, Jianghai, Haidong, Wangbao, and Lusi) and a total area of 1208 km^2. In 2007, the population was 1.1 million.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1972, and a vital statistics system for all deaths was established in 1974. Both initiatives are supervised by the Qidong Liver Cancer Institute (QDLCI). The registry uses active and passive data collection methods. All data received from smaller registries and hospitals are checked against cancer report lists and death-certificate-notified (DCN) cases to identify missing cases and prevent duplicate registration. New cancer cases in the catchment area are recorded, checked, and reported to the registry. If the registry receives a death notification before any other notifications of a new case, the patient's medical records are reviewed and a home visit may be carried out to obtain further information. As a result of this process, the proportion of death-certificate-only (DCO) cases is very low. The registry uses ICD-10 for coding the sites of malignant tumours, and ICD-O-3 for coding their histology. DEPedits software is used to prepare the data.



USE OF THE DATA

Registry data have been used mainly for epidemiological and etiological research investigating cancer of the liver (and other sites), other cancer research projects, monitoring of treatment outcomes, and government and health department decision-making for disease control. The registry publishes an annual report on cancer incidence and mortality, and special studies (such as screening evaluations, survival analyses, and studies on chemoprevention of liver cancer) have been performed. Registry data have been published in Chinese and international peer-reviewed journals.

China, Shanghai City

REGISTRATION AREA

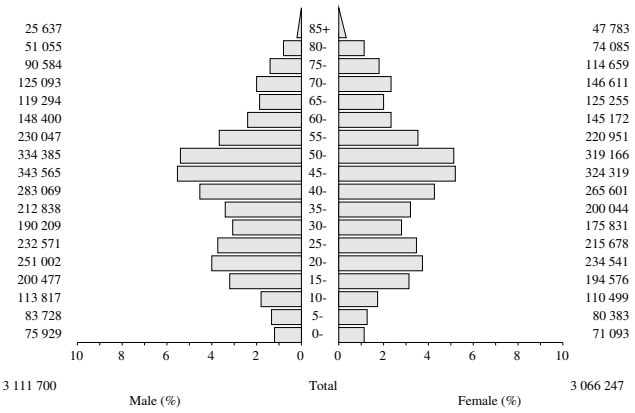
The municipality of Shanghai is located on the east coast of China. It has a total area of 6340.5 km^2 and a population of about 13.5 million, and is divided into 16 districts and one county. During the 2003–2007 reporting period, the Shanghai Cancer Registry covered nine of Shanghai's urban districts, with a covered area of about 289.4 km^2 and a covered population of 6.2 million.

CANCER CARE FACILITIES

Shanghai has a three-level general health care network made up of more than 400 hospitals and community health service centres. The first-level facilities are the community health service centres, which provide predominantly primary health care. The second-level facilities are the district hospitals, most of which have an oncology department. The third-level facilities are the general and specialized hospitals. Most second- and third-level facilities are equipped to diagnose and treat cancer.

REGISTRY STRUCTURE AND METHODS

The registry is affiliated with the Shanghai Municipal Center for Disease Control and Prevention (CDC) and is staffed by two senior and three junior epidemiologists, two statisticians, and an assistant statistician. About 20 other epidemiologists and 20 assistants in local CDCs are also involved. All medical facilities that diagnose and treat cancer (about 180) are required to report all newly diagnosed cancers and benign tumours of the central nervous system, using a standardized notification card. Data linkage with the permanent resident registry is also used, together with home visits (when necessary), to determine whether a given patient is a permanent resident. The data on cancer notification cards are computerized using specially designed software that recognizes Chinese characters. Cancer patients' death certificates are obtained monthly from the Shanghai Vital Statistics database, and collated with the registry database.



USE OF THE DATA

The registry publishes the annual *Shanghai Cancer Report* and provides data for evaluating cancer control programmes.

SOURCE OF POPULATION

Based on data from the real-time population registry system (covering permanent Shanghai residents) established by the Shanghai Municipal Bureau of Public Security in 2005 (for 2005–2007). Estimates for 2003 and 2004 interpolated based on the 2000 census and real-time population data for 2005.

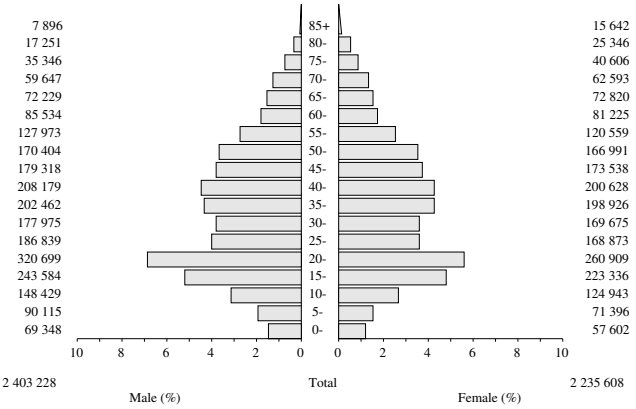
*See note following population pyramid

China, Wuhan City

REGISTRATION AREA
Wuhan is the largest city in central China, with a population of about 8 million (97% Han Chinese). It is an industrial and commercial city and the capital of Hubei Province. The Wuhan Cancer Registry covers 9 of the city's 13 districts. In 2005, the covered population was 4.7 million.

CANCER CARE FACILITIES
There are several types of hospitals in Wuhan. National, provincial, and municipal hospitals and most district hospitals provide radiotherapy, cancer surgery, and chemotherapy services. The Hubei Cancer Hospital specializes in cancer diagnosis and treatment.



REGISTRY STRUCTURE AND METHODS
The registry was established in 1980 by the Wuhan Center for Disease Prevention and Control (CDC) and is staffed by 19 full-time registrars and 20 part-time medical officers. Medical facilities are required by Wuhan Public Health Bureau regulations to report all newly diagnosed cancers, as well as benign tumours of the central nervous system. Physicians complete standardized notification cards, and each medical facility has a special department that collects the cards and submits them to the registry. Registry staff members check, code, and file the cards according to year, sex, permanent residence, and ICD code. They also determine whether each case has already been reported, to avoid duplication. Cancer patients' death certificates are collected from the Vital Statistics Section of the Wuhan CDC and compared against the registry database. If a deceased patient's case is already registered, his or her vital status is updated. If not, registry staff members interview relatives to obtain more complete information.

INTERPRETING THE RESULTS
Wuhan has a full range of diagnostic facilities, so it is unlikely that cases will be missed due to referral outside of the registration area.

USE OF THE DATA
The registry produces an annual report on cancer incidence and mortality for the Wuhan Public Health Bureau. Registry data are also used in epidemiological studies.

China, Yangcheng County

REGISTRATION AREA

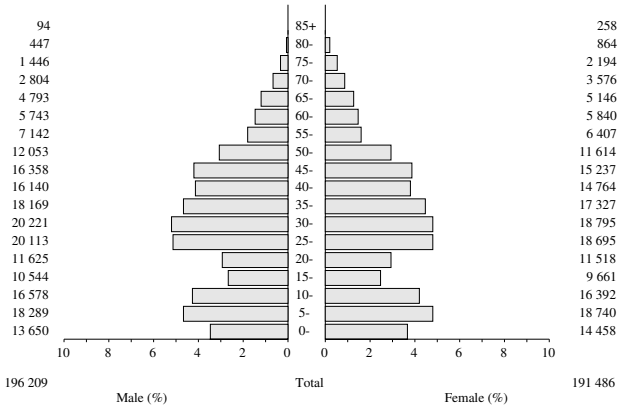
The Yangcheng Cancer Registry covers Yangcheng County in the south-eastern part of Shanxi Province. The county contains 17 townships and 468 administrative villages and has a total area of 1968 km^2. In 2003, the population was 390 000 (more than 95% Han Chinese). The population is slowly declining, with a decrease of about 4500 residents (1.2%) from 2003 to 2007. Occupations are diverse, but there is an emphasis on agriculture and manufacturing.

REGISTRY STRUCTURE AND METHODS

In 1974, the Yangcheng Cancer Hospital was enrolled in the national disease surveillance network by the Chinese Ministry of Health, leading to the establishment of the registry. Although cancer is not a reportable disease in China, the Shanxi Province Department of Health requires all medical institutions, township health centres, and village clinics in the province to regularly provide data about cancer incidence and mortality by submitting cancer notification cards and residents' death certificates to the registry. The registry uses ICD-10 and ICD-O-3 for coding and statistics, and has used CanReg4 software for data management since 1998. All new cases of malignant tumours and benign tumours of the central nervous system are registered. Reports of carcinoma in situ cases are also collected but are not included in the registry's cancer statistics report.

INTERPRETING THE RESULTS

Yangcheng has one of the highest cancer incidence rates in China, with a particularly high incidence of digestive cancers.



USE OF THE DATA

The registry collaborates with the Chinese National Office for Cancer Prevention and Control and participates in many scientific research projects.

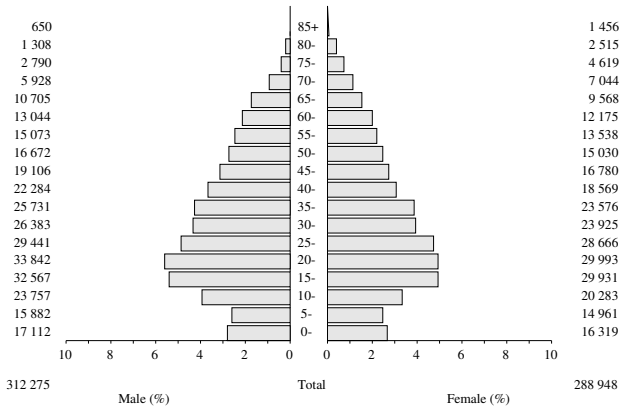
China, Yanting County

REGISTRATION AREA
The Yanting Cancer Registry covers Yanting County in the north-east of Sichuan Province in China. The county has an area of 1647 km^2. In 2005, the population was 601 000, with about 89% of residents living in rural areas and the rest in towns.

CANCER CARE FACILITIES
General health care is provided predominantly by the county's health administrative department through county and district hospitals and a network of primary health centres. Patients diagnosed with or suspected to have cancer are typically referred by primary and secondary care facilities to the Yanting Cancer Hospital, which has radiotherapy, surgical oncology, and chemotherapy departments.



REGISTRY STRUCTURE AND METHODS
Population-based cancer registration was initiated in 1970. The registry is located within the department of epidemiology at the Yanting Cancer Institute and is funded by the institute and the Sichuan Yanting Health Bureau. The registry is staffed by five full-time registrars and 50 part-time interviewers. The registry uses active case finding. The death registration system (also part of the registry) is accurate and complete. A definite cause is registered for most deaths. Registry staff members periodically visit hospitals and other health services to review the files kept by the medical records and pathology departments and clinical laboratories, and to abstract data on cancer cases. Relevant information is also collected through annual home visits to residents outside the registration area.

INTERPRETING THE RESULTS
Cancer incidence rates, particularly those of oesophageal and gastric cancers, have been high for several decades. In 1971–1978, the West China Medical University launched an epidemiological investigation of this phenomenon. However, no specific occupational exposures or other factors have yet been identified to explain the high rates.

USE OF THE DATA
Registry data have been used in 26 studies on the etiology and epidemiology of oesophageal and gastric cancers.

China, Zhongshan City

REGISTRATION AREA

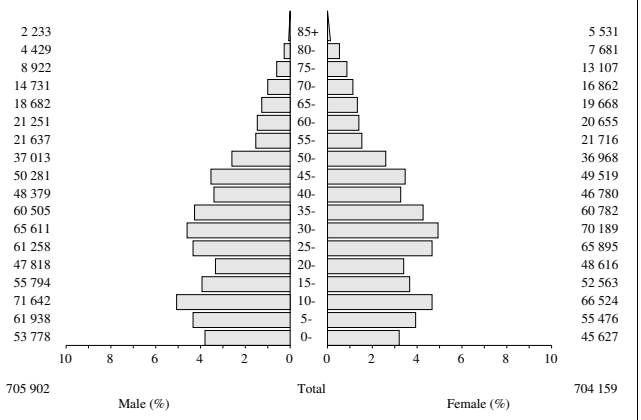
The Zhongshan Cancer Registry covers the prefecture-level city of Zhongshan, which is located 86 km north of Guangzhou (the capital city of Guangdong Province) in China. Zhongshan has an area of 1800 km^2 and is divided into 24 districts and towns. In 2012, the population was 1.5 million, with 88% of residents living in urban areas.

CANCER CARE FACILITIES

Health care is provided by the Zhongshan Health Bureau through a network of hospitals, clinics, the Zhongshan Center for Disease Control and Prevention, and private practitioners. There are no private cancer centres or cancer hospitals, but each public general hospital has a cancer department that provides cancer surgery and chemotherapy, and two hospitals provide radiotherapy. Some cancer patients are diagnosed and/or treated in hospitals in nearby regions, such as Guangzhou.

REGISTRY STRUCTURE AND METHODS

The registry is affiliated with the Zhongshan People's Hospital and is funded by the hospital and the health departments of Zhongshan and Guangzhou. The registry is staffed by a full-time medical officer and two full-time registrars. Each hospital in Zhongshan also has a part-time registrar who collects cancer data and performs follow-up. The hospital registrars conduct mainly active case finding, through computers connected to hospital workstations. The cancer data they collect are emailed to the registry, where the data are checked for consistency. Inconsistent data are sent back to the registrars for correction. The registry is currently developing automated cancer registration software. Additional registration data are collected through regular visits to hospitals in neighbouring regions.



USE OF THE DATA

The registry began publishing an annual cancer report in 2003. Registry data have been used in many scientific papers and one monograph. The registry also carries out its own research projects on topics such as oesophageal cancer control.

CONTRIBUTORS

Yuan-Long Yu

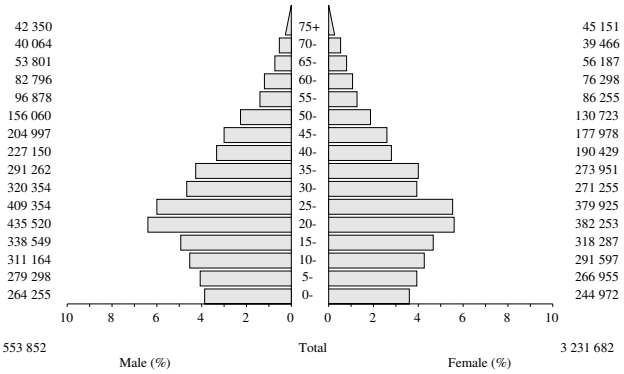
India, Bangalore

REGISTRATION AREA
The Cancer Registry of Bangalore covers the Bangalore Urban Agglomeration, which has an area of 741 km^2 and is the capital of the Indian state of Karnataka.

CANCER CARE FACILITIES
The Kidwai Memorial Institute of Oncology in Bangalore is a regional cancer centre with state-of-the-art facilities for cancer diagnosis, treatment, education, and research. It offers specialized courses in oncology and related subjects and serves patients from Karnataka and neighbouring states.



REGISTRY STRUCTURE AND METHODS
The registry was established in 1981 as part of the National Cancer Registry Programme (NCRP) of the Indian Council of Medical Research (ICMR) and is funded partly by the ICMR. The registry is staffed by a principal investigator, a co-principal investigator, two biostatisticians, a field supervisor, and six assistant social scientists. Case finding is active. The registry has 475 data sources, including cancer hospitals, general hospitals, pathology laboratories, and municipal death registration offices. Registry staff members visit the sources to review medical records, pathology registers, and reports, and to abstract information on resident cases. Quality checks, checks for duplicates, and other analyses are performed using software developed by the NCRP.

INTERPRETING THE RESULTS
Since 2002, the area covered has increased from 366 km^2 to 741 km^2. The Kidwai Memorial Institute of Oncology facilitates opportunistic screening. Cancer detection initiatives are conducted within and around Karnataka.

USE OF THE DATA
The registry publishes an annual incidence report highlighting trends and changes. The report is presented at the NCRP's Annual Review Meeting, during which registries from throughout India present their data and recommendations are made. The registry has also undertaken several epidemiological studies for specific cancers.

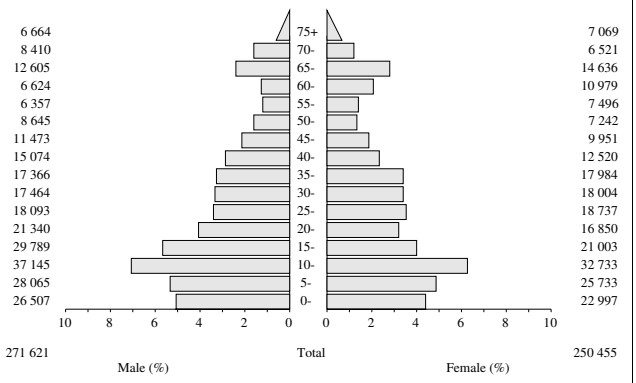
India; Barshi, Paranda, and Bhum

REGISTRATION AREA
The Rural Cancer Registry, Barshi covers the rural area of three municipalities in the state of Maharashtra in western India: Barshi in the Solapur district and Paranda and Bhum in the Osmanabad district.



CANCER CARE FACILITIES
Villagers seek medical advice and treatment from many major and minor hospitals, some as far away as 400 km. However, more than 60% of cancer patients are treated at the Nargis Dutt Memorial Cancer Hospital.

REGISTRY STRUCTURE AND METHODS
The registry has adopted a special methodology suitable for local conditions. In addition to collecting data, the registry also promotes cancer awareness and early detection initiatives. Trained social investigators regularly visit the villages to collect incidence and mortality data directly from community and primary health centres, government health workers, and private physicians, and to request that suspected cancer cases be referred to diagnostic centres. Cancer detection clinics are periodically organized in the area's primary health centres to screen for symptomatic cases. Additional data on registered cases are collected from 75 hospitals, various pathology laboratories, and all diagnostic centres. Residential status and vital status are confirmed by visiting patients' villages. Information on deaths is collected from village death records, from all major hospitals, and directly from the local community. Because deaths are generally not medically certified and cause of death information is often inaccurate, registry staff members make home visits to patients' relatives to ascertain cause of death and perform trace-back to the associated medical records from the treating hospital or physician.

INTERPRETING THE RESULTS
Because of the registry's special methodology, it is unlikely that diagnosed cases will be missed, and this has been confirmed by annual sample surveys. Within the registration area, almost every death is registered with a cause of death recorded. The proportion of death-certificate-only (DCO) cases registered is extremely low, meaning that nearly all cancer cases are already registered before the patients' deaths.

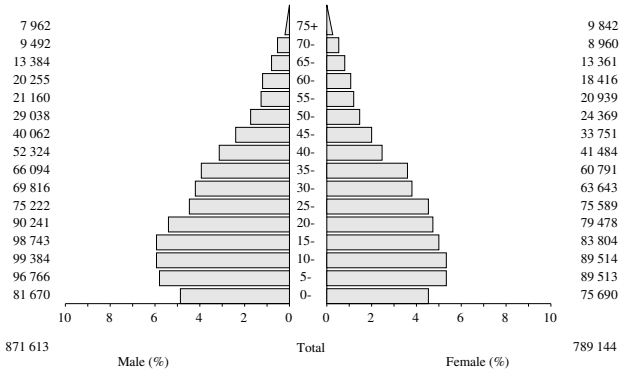
India, Bhopal

REGISTRATION AREA
The Bhopal Population-based Cancer Registry covers the city of Bhopal, which is the capital of the Indian state of Madhya Pradesh.



CANCER CARE FACILITIES
There are five cancer treatment centres that provide comprehensive cancer care to patients in Bhopal.

REGISTRY STRUCTURE AND METHODS
In 1984, a chemical disaster caused by a toxic gas leak at a Union Carbide pesticide factory in Bhopal resulted in massive mortality and morbidity in the city. The main component of the toxic gas cloud was methyl isocyanate (MIC). After the disaster, the Indian Council of Medical Research initiated many studies to evaluate the resulting health effects, and a population-based cancer registry was established in Bhopal, as part of India's National Cancer Registry Programme (NCRP), to determine the burden of cancer in central India and to evaluate the carcinogenic effects of MIC, if any, on the gas-exposed population. The registry has 77 data sources, including tertiary health care centres, imaging and pathology diagnostic centres, and five cancer treatment centres. The registry's social investigators actively collect data by visiting the information sources and interviewing patients. Additional information is collected from medical records. NCRP and IARC checks are used to ensure data quality.

USE OF THE DATA
Registry data are used to help formulate the policies of the National Cancer Control Programme.

India, Chennai

REGISTRATION AREA

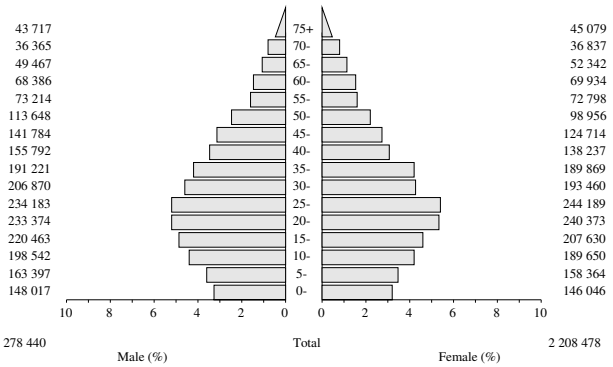
The Madras Metropolitan Tumour Registry (MMTR) covers an entirely urban area of 170 km^2 within the metropolitan limits of Chennai, which is the capital of the Indian state of Tamil Nadu. In 2005, the covered population was 4.5 million, accounting for 0.4% and 6.5% of the total populations of the country and the state, respectively.

CANCER CARE FACILITIES

Cancer diagnosis and treatment are provided primarily by government health services, including the Cancer Institute (WIA) Chennai, which is one of the Indian Ministry of Health and Family Welfare's regional cancer centres. Some care is also provided by private practitioners and hospitals. Radiotherapy is available at four government hospitals and eight private hospitals. Surgery and chemotherapy are provided by all major hospitals.

REGISTRY STRUCTURE AND METHODS

The MMTR was established at the Cancer Institute (WIA) Chennai in 1981 as part of India's National Cancer Registry Programme (NCRP). Data collection is active. The registry receives good cooperation from all health care facilities in and around Chennai, and has more than 230 information sources (government and private hospitals, nursing homes, consultants, pathology laboratories, imaging centres, and hospices). MMTR registrars visit these sources regularly and collect data by interviewing patients (when possible) and from medical records. Mortality data are collected from the Vital Statistics Division of the Corporation of Chennai. Data reliability and quality are continually monitored, with an emphasis on case finding. Validity checks are done using IARC, NCRP, and registry-developed software.



USE OF THE DATA

The registry periodically publishes reports and descriptive epidemiological studies on cancer incidence patterns and trends. The MMTR also provides expertise to the Dindigul Ambilikkai Cancer Registry in Tamil Nadu.

India, Dindigul, Ambilikkai

REGISTRATION AREA

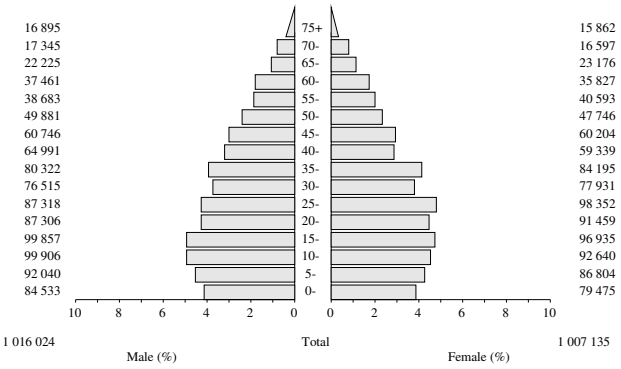
The Dindigul Ambilikkai Cancer Registry (DACR) covers the Dindigul district in the Indian state of Tamil Nadu. The district has an area of 6267 km^2 and in 2005 had a population (predominantly rural) of 2 million.

CANCER CARE FACILITIES

Cancer diagnosis and treatment are provided by government health services and supplemented by private practitioners and hospitals. Radiotherapy is available at the Christian Fellowship Community Health Centre (CFCHC) in Dindigul district, and in 10 other hospitals in neighbouring districts. Surgery and chemotherapy are provided by all major hospitals, and pathology and imaging services are widely available in neighbouring districts.

REGISTRY STRUCTURE AND METHODS

The DACR was established in 2004, with special emphasis on the evaluation of a field intervention trial on cervical cancer that was under way in the region. The registry includes data on incident cancers diagnosed since 2003. The DACR is based at the Cancer Institute (WIA) Chennai and has a field office at the CFCHC in the village of Ambilikkai. The registry is funded by IARC. Information is actively collected from 103 data sources: 33 in the Dindigul district, 22 in five adjoining districts, and 48 in five distant districts (including Chennai). The sources are government and private hospitals, nursing homes, consultants, pathology laboratories, imaging centres, and hospices. DACR registrars visit the sources regularly to collect data from medical records. Home visits for each registered case are conducted annually to improve data completeness. Mortality data are collected from the vital statistics division of the directorate of public health and from subdistrict offices. Validity checks are done using IARC and registry-developed software.



USE OF THE DATA

The DACR has published several descriptive epidemiological studies on cancer incidence patterns. It was also instrumental in evaluating the population-based cervical cancer intervention trial in Dindigul district, which paved the way for the state government to establish cancer screening programmes in other districts. In the future, the DACR will monitor participants in the human papillomavirus vaccine trial in Ambilikkai for cervical neoplasia and will support the evaluation of breast cancer early detection initiatives in Dindigul district.

India, Dindigul, Ambilikkai (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Extrapolated from 1991 and 2001 census data by difference distribution method using an exponential growth rate (Takiar and Shobana, 2009). Population estimates by 5-year age groups for 1991 and 2001 and all-ages totals for 2011 were used when available.

NOTES ON THE DATA

*No official mortality data.

India, Karunagappally

REGISTRATION AREA

The Karunagappally Rural Cancer Registry covers the *taluk* (subdistrict) of Karunagappally (an area of 192 km^2) in the Kollam district of the Indian state of Kerala. The area is rural, with lowlands, backwaters, and coastlines. The coastal belt of Karunagappally is internationally known for its rich deposits of naturally occurring radioactive mineral sands. The population is stable, with 2000 residents/km^2. Most residents are agricultural labourers, fishermen, or coconut fibre labourers. The major religions are Hinduism, Christianity, and Islam. The literacy rate is more than 85%.

CANCER CARE FACILITIES

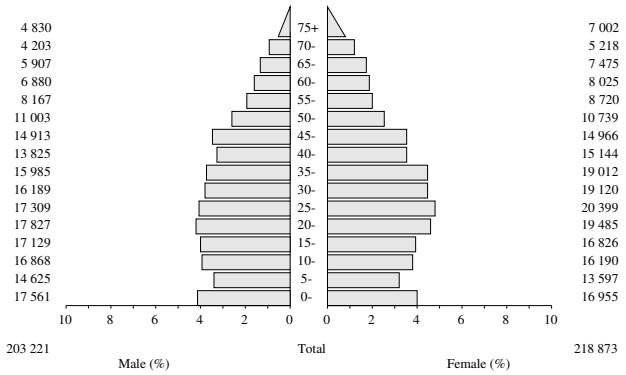
There are no dedicated cancer treatment centres in the area, but the Regional Cancer Centre in Thiruvananthapuram is located about 100 km away.

REGISTRY STRUCTURE AND METHODS

The registry (Kerala's first population-based cancer registry) was established in 1990 by the Regional Cancer Centre in Thiruvananthapuram, with government funding from the Indian Department of Atomic Energy, as a special-purpose registry to study cancer and the natural radiation present along the coast of Karunagappally. Since 1999, the registry has received funding from the Japanese Health Research Foundation and the government of Kerala's Local Administration Department. In January 2006, the registry was extended to cover the entire Kollam district, with funding from the Indian Council of Medical Research. The registry has 15 staff members and uses active case finding. Registry investigators visit and abstract data from pathology laboratories, medical colleges with oncology units, private and government hospitals, and the vital statistics divisions of the district and nearby towns. The collected data are then processed and registered.

INTERPRETING THE RESULTS

Although there are no cancer treatment facilities in the registration area, the area's high literacy rates, good communications infrastructure, and high levels of health awareness, as well as the dedicated services established for cancer care by the Regional Cancer Centre, enhance the quality of registry activities.



USE OF THE DATA

Registry data are used for organizing cancer control and epidemiological studies, which investigate mainly the effects of chronic exposure to the natural radiation in the area.

India, Mizoram

REGISTRATION AREA

The Mizoram Population-based Cancer Registry covers the state of Mizoram in north-eastern India between Myanmar and Bangladesh. The residents are ethnically different than elsewhere in India; they are of Mongoloid origin, and most are Christian. The population is a mix of urban and rural.

CANCER CARE FACILITIES

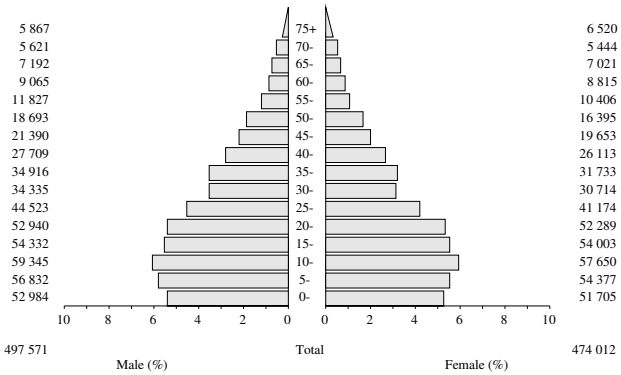
The main referral hospital is the Aizawl Civil Hospital, which is also a regional cancer centre. It provides radiotherapy, pathology, computed tomography, and cancer surgery. Histopathology, computed tomography, magnetic resonance imaging, and endoscopy are available in some private hospitals and diagnostic centres.

REGISTRY STRUCTURE AND METHODS

The registry was established at the Aizawl Civil Hospital in 2003 as part of the National Cancer Registry Programme (NCRP) of the Indian Council of Medical Research, which funds the project. The registry is staffed by part-time pathologists and oncologists and seven full-time employees: a principal investigator/ director (a pathologist) and six co-investigators. Data collection is active, with staff members regularly visiting the sources (hospitals, laboratories, and diagnostic centres). Mortality data are collected from about 700 birth and death registers throughout the state. Checks for duplicates and consistency are carried out first at the registry and again at the NCRP headquarters in Bangalore.

INTERPRETING THE RESULTS

There have been no changes in the area or population covered. There are no organized screening programmes in the state. National and international tobacco use surveys have consistently shown very high rates of tobacco smoking and smokeless tobacco use among both men and women in Mizoram.



USE OF THE DATA

Registry data are published by the NCRP (along with other data) annually or biennially. Several research projects, some of which have already been published, have been initiated to investigate Mizoram's consistently high incidence rates of certain cancers (such as gastric, lung, and oesophageal cancers) and overall compared with other registration areas in India. Tobacco control programmes have been initiated.

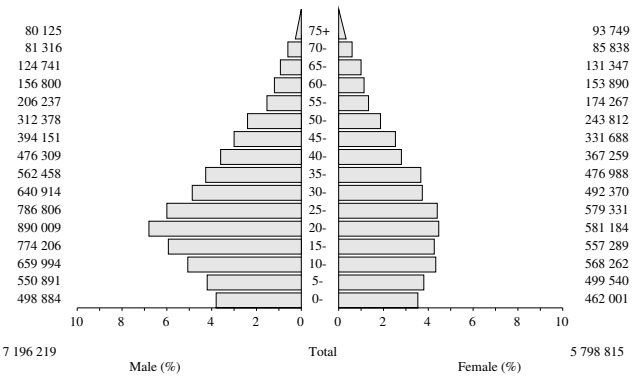
REGISTRATION AREA
The Mumbai Cancer Registry covers the metropolis of Greater Mumbai, which is an island on the west coast of India joined to the mainland by bridges. It has an area of 437.7 km^2 and a warm, humid climate. In 2001, the population was 11.9 million, with a sex ratio of 811 females per 1000 males. Greater Mumbai is the most densely populated district in India, with 2220 residents/km^2.

CANCER CARE FACILITIES
The Municipal Corporation of Greater Mumbai and the state government run most hospitals in Mumbai, including the Tata Memorial Centre, which specializes in cancer. Cancer diagnosis and treatment are centralized to certain hospitals. There have been substantial improvements in diagnostic facilities, and histopathology and imaging facilities are now available within the registration area. The number of hospital radiotherapy departments in the area has increased from two to nine.



REGISTRY STRUCTURE AND METHODS
The registry was established in 1963 as a unit of the Indian Cancer Society, for the purpose of obtaining reliable cancer incidence and mortality data from a precisely defined urban population. Data compilation began in 1964. The registry was established in collaboration with the Biometric Research Branch of the United States National Cancer Institute and received funding from the branch until 1975. Since 1981, the registry has been funded partly by the Indian Council of Medical Research. Registry staff members visit the wards of all participating hospitals at least weekly to personally interview each patient diagnosed with or suspected to have cancer. All files maintained by the various departments of these hospitals are individually cross-checked. Care is taken to prevent duplicate registrations.

INTERPRETING THE RESULTS
Tobacco chewing is very prevalent in both sexes. Smoking (particularly bidi smoking) is prevalent among men but less common among women.

USE OF THE DATA
The registry publishes annual reports and has published numerous journal articles and monographs. Registry data are also used by public health workers for etiological and cancer control studies. The registry is a rich source of data for studying time trends in cancer incidence and mortality.

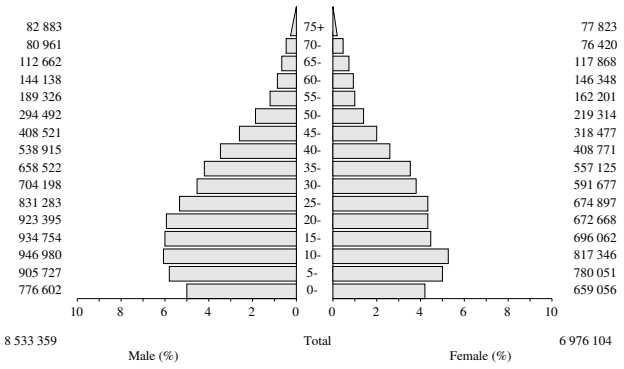
India, New Delhi

REGISTRATION AREA

The Delhi Cancer Registry covers an urban area of 890 km^2 in Delhi, the capital territory of India. For census purposes, urban Delhi was divided into three statutory towns (the Municipal Corporation of Delhi, the New Delhi Municipal Council, and the Delhi Cantonment) and 29 census towns. In 2001, the population of urban Delhi was 12.8 million. The sex ratio in Delhi is 822 females per 1000 males, and the population density is 9294 residents/km^2.

REGISTRY STRUCTURE AND METHODS

The registry is based at the Dr. B.R. Ambedkar Institute Rotary Cancer Hospital of the All India Institute of Medical Sciences in New Delhi. It collects cancer morbidity and mortality data from 165 major government hospitals, centres, and institutions; more than 250 private hospitals and nursing homes; and municipal vital statistics departments. The registry is staffed by two scientists (a statistician and a medical officer), nine medical social workers (MSWs), a data entry operator, and a lower-division clerk. The MSWs visit participating hospitals and nursing homes and collect data from the relevant departments. Smaller nursing homes and clinics are contacted by mail, and data are collected on a notification form. Hospitals outside the registration area notify the registry of resident cases that they diagnose or treat. The death registration system in the area is inadequate and incomplete, and cause of death is often recorded simply as cardiorespiratory arrest. All hospital death records are checked against morbidity records, and cases with no matching morbidity records are registered as death-certificate-only (DCO) cases. Registry data are coded using ICD-O-3 and ICD-10. Consistency and validity checks are carried out to detect coding or keying errors.



USE OF THE DATA

The registry publishes annual and biennial reports on cancer incidence and mortality, highlighting trends and changes.

India, Poona

REGISTRATION AREA

The Poona Cancer Registry (a satellite of the Mumbai Cancer Registry) covers the urban agglomeration of Poona (also called Pune) within the district of Poona in the Indian state of Maharashtra. The agglomeration has an area of 344.18 km^2. In 2001, the population was 3.6 million, with a density of 10 330 residents/km^2; 79.7% were Hindu, 8.9% Muslim, 2.6% Christian, 5.8% Neo-Buddhist, and 2.2% Jain. The lowest average temperature is 9 °C in January, and the highest average temperature is 40 °C in May. The climate is dry, with an average annual rainfall of about 900 mm.

CANCER CARE FACILITIES

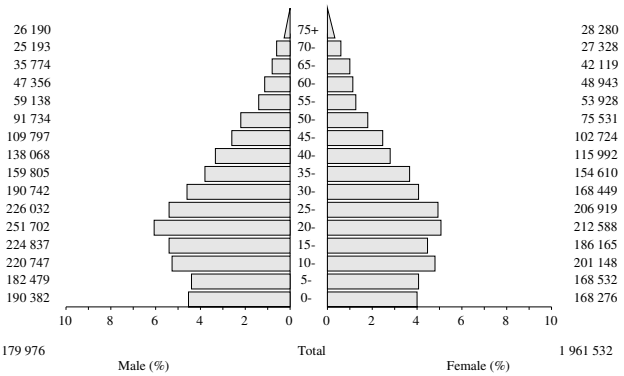
Patients from Poona often seek cancer treatment at the Tata Memorial Centre in Mumbai, which specializes in cancer. There are also 35 hospitals in Poona that provide cancer diagnosis and treatment services. There are two radiotherapy centres in the city of Poona, and chemotherapy is available in nine hospitals.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1972 by the BJ Medical College and the Sassoon Hospital in Poona. The registry has three social investigators (who conduct active case finding) and a supervisor (who performs administration and ensures data completeness). Editing, coding, and analysis are carried out by the Mumbai Cancer Registry. Information is collected on all cancer patients who visit hospitals in Poona and on Poona residents who receive treatment at the Tata Memorial Centre and other leading hospitals in Mumbai. The registry collects data from 16 major hospitals in Poona and six major hospitals in Mumbai. General medical practitioners are not contacted individually. Death records maintained by the Pune Municipal Corporation are used to check for missed cases. Registry data are checked for duplication using software such as PBCRDM and Excel.

INTERPRETING THE RESULTS

There are no screening programmes in the registration area. Tobacco chewing is very prevalent in both sexes. Smoking (particularly bidi smoking) is prevalent among men but uncommon among women.



USE OF THE DATA

The registry publishes a report every 5 years. The state government uses registry data for district cancer control programmes, and the data are also used by public health workers for etiological and cancer control studies.

CONTRIBUTORS

Arun Kurkure
Shravani Koyande
P.S. Adhav

India, Poona (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Extrapolated from 1991 and 2001 census data by difference distribution method using an exponential growth rate (Takiar and Shobana, 2009). Population estimates by 5-year age groups for 1991 and 2001 and all-ages totals for 2011 were used when available.

NOTES ON THE DATA

*No official mortality data. Fluctuation in rates from year to year.

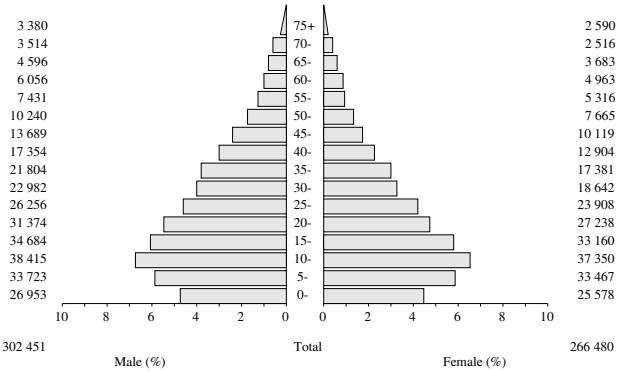
India, Sikkim State

REGISTRATION AREA
The Sikkim Population-based Cancer Registry covers the Indian state of Sikkim. In 2001, the population was 540 000.



CANCER CARE FACILITIES
Sikkim does not have a dedicated cancer treatment centre. Most patients diagnosed with cancer are referred for treatment in Kolkata, New Delhi, or Mumbai.

REGISTRY STRUCTURE AND METHODS
The registry was established in 2003 as part of the National Cancer Registry Programme (NCRP) of the Indian Council of Medical Research. It is located in the Sir Thutob Namgyal Memorial (STNM) Hospital in Gangtok. The registry is staffed by a principal investigator, a research officer, a programmer, a statistician, a data entry operator, and two social investigators. Data collection is active, and cases are classified as either resident or non-resident. Data analysis is conducted using NCRP software. Consistency checks are done at the registry office in Gangtok and by the NCRP in Bangalore. Deaths that occur in hospitals or primary health centres are certified by the medical officer in charge, and death certificates are sent to the Office of the Registrar General in Gangtok on a monthly basis. Deaths that occur at home are certified by the local *panchayat* (council) or *anganwadi* (basic health centre) or by a community social worker. The registry's social investigators visit all sources that maintain mortality records. When cancer is listed as the cause of death but no other information can be found, cases are categorized as death-certification-only (DCO) cases. Every year, mortality data are matched with the corresponding incidence data from the current and previous years and the records are updated.

USE OF THE DATA
The registry periodically publishes reports and descriptive epidemiological studies.

India, Trivandrum

REGISTRATION AREA

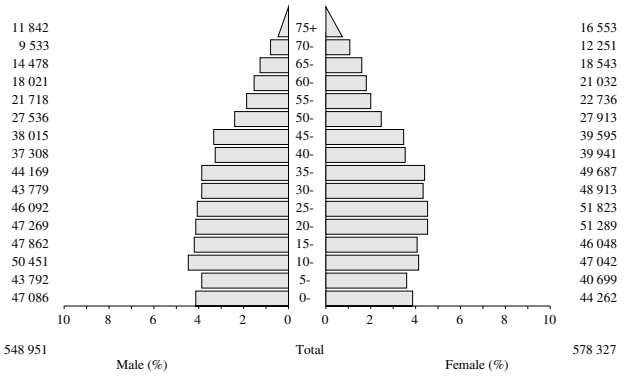
The Thiruvananthapuram Cancer Registry covers the city of Trivandrum (also called Thiruvananthapuram) and three adjoining rural community development blocks within the *taluk* (subdistrict) of Thiruvananthapuram in the Indian state of Kerala. The *taluk* has an area of 300 km^2 and in 2001 had a population of 1.1 million (67% urban and 33% rural).

CANCER CARE FACILITIES

There are 37 government hospitals, 28 private hospitals, and seven pathology laboratories in Thiruvananthapuram.

REGISTRY STRUCTURE AND METHODS

A cancer registry was first established in the area in 1994, with retrospective data collection since 1991. The current registry was established in 2006 as part of the National Cancer Registry Programme (NCRP) of the Indian Council of Medical Research. Retrospective data collection goes back to 1 January 2005. A reliable data collection procedure was established by the original registry, and the same methodology has been adopted by the Thiruvananthapuram Cancer Registry. Registry staff members routinely visit government and private hospitals and pathology laboratories. The main sources of incidence data are the Regional Cancer Centre and the Medical College Hospital in Thiruvananthapuram. Registry staff members abstract incidence and mortality data on all malignant tumours using a standard format, a procedure manual, and a user guide provided by the NCRP. In situ lesions and neoplasms of uncertain behaviour are also recorded but are not included in incidence figures. Because cause of death information is generally not accurate, information on all deaths except those due to accidents or natural disasters is collected from the vital statistics offices and compared against the current and original registry databases. About 90% of cases in the current registry are also covered by the original registry. Any cancer death with no corresponding record in the databases is registered as a death-certificate-only (DCO) case. Follow-up information and survival data are collected by telephone and through the mail.



USE OF THE DATA

The data have been used extensively for the planning and evaluation of cancer control programmes throughout Kerala.

Islamic Republic of Iran, Golestan Province

REGISTRATION AREA

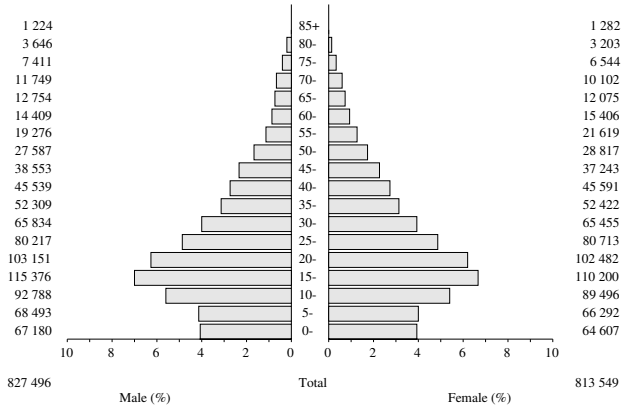
The Golestan Population-based Cancer Registry (GPCR) covers Golestan Province in the north-eastern Islamic Republic of Iran. The province's land area is 20 438 km^2 (about 1.3% of the country's total land area). About half of the province's residents live in urban areas.

CANCER CARE FACILITIES

Golestan has 20 hospitals. Almost all cancer diagnostic and therapeutic services, including open and laparoscopic surgeries, radiotherapy, chemotherapy, computed tomography, magnetic resonance imaging, upper endoscopy, colonoscopy, sonography, mammography, and pathological examination, are available throughout the province. The provincial health network also includes 120 health care centres that provide various public health services for residents, including cancer prevention programmes.

REGISTRY STRUCTURE AND METHODS

The GPCR was established by the Golestan Research Center of Gastroenterology and Hepatology, Golestan University of Medical Sciences (GOUMS) under the supervision of the Digestive Disease Research Center, Tehran University of Medical Sciences. The registry collects information from 68 public and private sources within the province, including hospitals, pathology laboratories, imaging centres, and specialists. It also obtains information from medical centres and regional registries in neighbouring provinces (particularly Razavi Khorasan, Mazandaran, and Tehran), to minimize the loss of data on resident cases diagnosed outside of Golestan. Data are collected both actively and passively, by well-trained staff members who regularly visit all sources. The GPCR also regularly receives information on cancer-related deaths from the death registry within the health department of GOUMS, and matches these data against the registry database to identify previously unreported cases, which are defined as death-certificate-only (DCO) cases. Procedures are in place to ensure the confidentiality, quality, and optimal use of data.



USE OF THE DATA

The GPCR publishes an annual report on cancer incidence and mortality. Registry data have also been used in several cross-sectional, case–control, and survival studies.

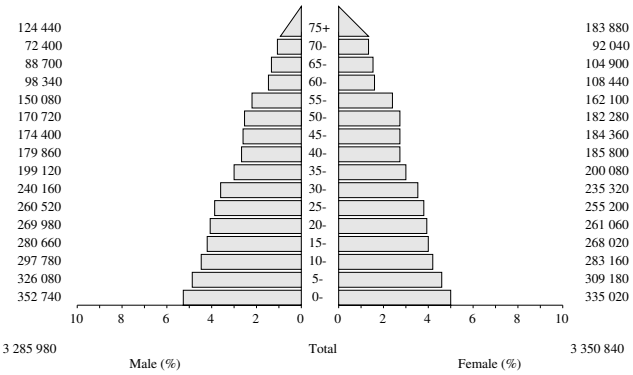
Israel

REGISTRATION AREA
The Israel National Cancer Registry (INCR) covers all of Israel. In 2009, the population was estimated to be 7.5 million (76% Jewish, 20% Arab, and 4% of other ethnicities).

CANCER CARE FACILITIES
Since 1995, all Israeli citizens have been entitled to a defined set of health care and preventive services, including services for the prevention, diagnosis, and treatment of cancer. Cancer care is provided in acute care hospitals, outpatient oncology and haematology centres, and physicians' offices. Most pathology laboratories are based in hospitals.



REGISTRY STRUCTURE AND METHODS
The INCR was first established in 1960, and cancer reporting has been mandatory for hospitals, pathology and cytology laboratories, and other health care providers since 1982. The registry records all incident cases of malignant neoplasms (excluding basal and squamous cell skin cancers), carcinoma in situ and high-grade intraepithelial neoplasia, and benign neoplasms of the brain and central nervous system. The INCR's information sources include pathology reports, hospital discharge summaries, death certificates from local health authorities, periodic reports from oncology programmes, and cause of death information from the Israel Central Bureau of Statistics. Demographic data are obtained from the Israel National Population Register and include name, dates of birth and death, sex, vital status, ethnicity, and address. For each case, trained registrars use the available documents to establish site and morphology according to ICD-O-3 coding and record grade, size, treatment provided, and stage according to the *SEER Summary Staging Manual*. Due to the wide range of data sources and the varying reporting frequencies, the registry generally requires about 2 years to ensure the complete ascertainment of cases diagnosed during a given year.

INTERPRETING THE RESULTS
The completeness of the INCR's data is estimated at 95–96% for solid tumours and 85% for haematopoietic tumours. Quality control activities are carried out by the Israel Center for Disease Control.

USE OF THE DATA
INCR data are used by government ministries, researchers, and the public for a range of purposes, including tracking cancer incidence and survival, making health policy and payment decisions, evaluating the effectiveness of screening and treatment programmes, and carrying out public education and research.

*See note following population pyramid

Japan, Aichi Prefecture

REGISTRATION AREA

The Aichi Cancer Registry (ACR) covers Aichi Prefecture, which is located in central Japan and flanked to the south by the Pacific Ocean. It has an area of 5146 km^2 and a population of 7.3 million. About 2% of the economically active population is engaged in primary industry, 42.8% in secondary industry, and 53.5% in tertiary industry. Buddhism is the dominant religion.

CANCER CARE FACILITIES

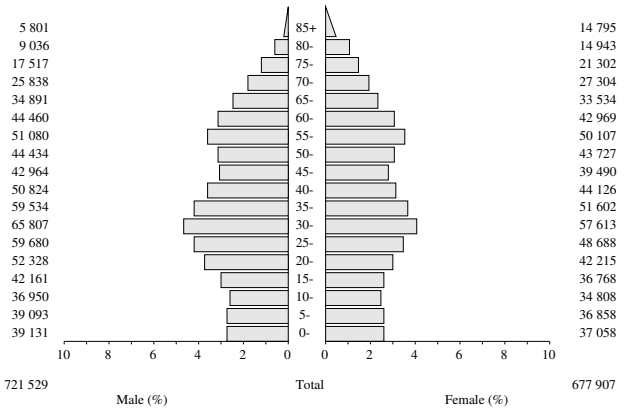
Diagnostic and treatment services for cancer are available and accessible throughout Aichi Prefecture. The prefecture is divided into 11 health care districts, and each district has at least one designated cancer care hospital; 15 designated cancer care hospitals have been certified by the Japanese Ministry of Health, Labour, and Welfare, and six hospitals have been certified by the Department of Health and Public Welfare, Aichi Prefecture (DHPW). These certified hospitals cover approximately 67% of cancer patients in the area.

REGISTRY STRUCTURE AND METHODS

The ACR is staffed by physicians/epidemiologists (1.5 full-time equivalents) and five registrars. It is operated by the DHPW and located within the Aichi Cancer Center Research Institute, which provides the registry with technical support. Notification is passive; all medical institutions in the area have been asked to report incident cases. Registered cases are annually matched against the area's death certificates. Non-matched cases are followed up to identify previously unreported cases, which are registered as death-certificate-only (DCO) cases.

INTERPRETING THE RESULTS

The ACR's data quality remains modest, due mainly to the registry's dependence on voluntary reporting, with no legal requirements. Over the past 20 years, the registry has set up a model area with good-quality registry data. The area is in the central part of the prefecture and has a population of 1.4 million. The local governments support gastric, colon, breast, lung, and cervical cancer screening. Prostate-specific antigen (PSA) testing is commonly available, but it is not defined as an official tool for prostate cancer screening.



USE OF THE DATA

The ACR provides descriptive data on cancer incidence, and registry data have been used in a variety of epidemiological investigations, including cohort studies, case–control studies, and evaluations of screening programmes. The data have also been used for planning and evaluating cancer control and for estimating cancer incidence in Japan.

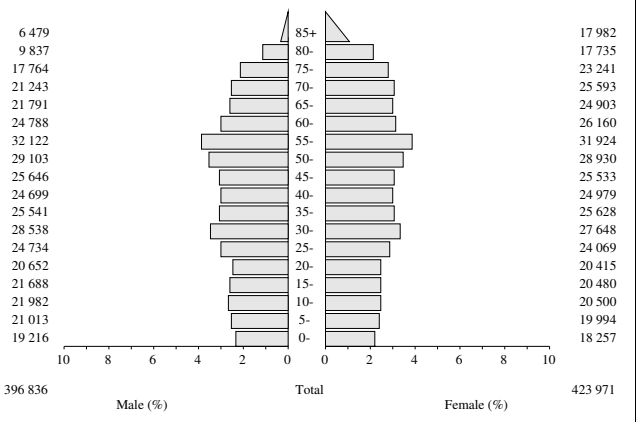
§Includes 3 cases of unknown age

§Includes 1 case of unknown age

Japan, Fukui Prefecture

REGISTRATION AREA
The Fukui Cancer Registry covers Fukui Prefecture in central Japan. The prefecture has a population of about 820 000 and an area of 4189 km^2.

CANCER CARE FACILITIES
The six main district hospitals provide radiotherapy, cancer surgery, and chemotherapy services. Patients suspected to have cancer are generally referred by primary and secondary care facilities to one of these hospitals.



REGISTRY STRUCTURE AND METHODS
In 1984, the Fukui Prefectural Government (FPG) established a system of voluntary cancer registration to obtain information about the nature and extent of the cancer burden in the prefecture and to assist in planning cancer control programmes. The Fukui Medical Association (FMA) is responsible for data collection. The registry is located within the FPG and is staffed by a part-time registrar and a full-time health worker. Each month, the central registry receives cancer reports from the FMA, as well as death certificates. The information is checked for consistency, coded, and computerized. Questionnaires are sent to physicians who have signed death certificates that cannot be matched with previous registrations. The data obtained with these questionnaires are also checked and computerized. All original copies of cancer reports and death certificates mentioning cancer are stored. Living cases are filed by the patient's date of birth, and deceased cases are grouped by the patient's year of death and filed by date of birth.

INTERPRETING THE RESULTS
There are organized screening programmes for gastric, colorectal, breast, lung, and cervical cancers. Prostate-specific antigen (PSA) testing is not defined as an official tool for prostate cancer screening.

USE OF THE DATA
Registry data are used for geographical analysis within the prefecture and for comparison of cancer morbidity in other parts of Japan. The registry publishes an annual report on cancer incidence, highlighting trends and changes. Special studies of survival among patients with gastric, colorectal, and cervical cancers have also been carried out using registry data. Policy-makers also use the data to evaluate screening programmes for gastric and colorectal cancers.

Japan, Hiroshima

REGISTRATION AREA

The Hiroshima Prefecture Cancer Registry (HPCR) covers the city of Hiroshima, the largest city in the Chugoku region of Japan. The city was rebuilt after its destruction by the atomic bombing in 1945. In 2005, 16.6% of residents were aged 65 years or more, compared with 14.2% in 2000. The town of Yuki (with a population of 7796 and an area of 162.9 km^2) was merged with Hiroshima in 2005.

CANCER CARE FACILITIES

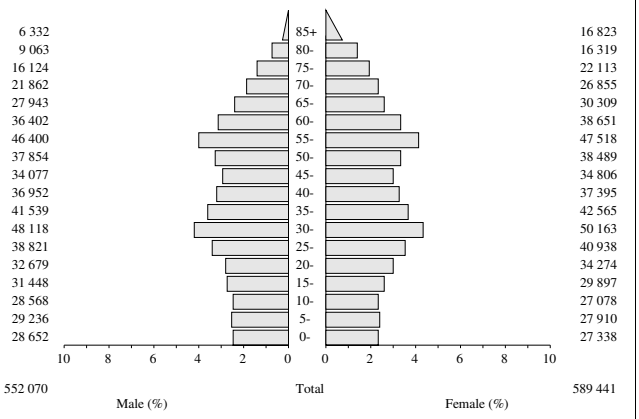
In 2005, there were 1501 hospital beds and 273 physicians per 100 000 residents. In 2006, the Japanese Ministry of Health, Labour, and Welfare designated four hospitals as cancer care hospitals, and these provide advanced cancer treatment, palliative care, patient information services, and professional training programmes.

REGISTRY STRUCTURE AND METHODS

The Hiroshima City Medical Association's Tumor Statistics Registry was established in 1957 and was renamed the Hiroshima Cancer Registry under the auspices of the municipal government in 2005. Data are collected mostly by the abstraction of medical records from major hospitals. The Hiroshima Prefecture Tissue Registry was started by the Hiroshima Prefectural Medical Association in 1973. Pathologists submit pathology records and provide sample slides of surgically removed tumours. The HPCR was started by the prefectural government in 2002 and collects data through voluntary notification from all hospitals and clinics. Death certificates are also collected, and trace-back surveys were initiated in 2005 (to request cancer diagnosis information for cases notified by death certificate only). Data from all three registries are summarized in the HPCR database. All registration activities have been supported by the Radiation Effects Research Foundation and its predecessor, the Atomic Bomb Casualty Commission.

INTERPRETING THE RESULTS

Data abstraction from major hospitals, the collection of pathology records, and the collection of data from hospital-based cancer registries in the cancer care hospitals guarantee a high quality of registration. Many atomic bomb survivors still live in Hiroshima, and the effects of atomic bomb radiation on cancer incidence persist.



USE OF THE DATA

Registry data are used for evaluating cancer incidence rates and cancer control programmes in the community. The registry also provides cancer incidence data for studies on the effects of radiation in atomic bomb survivors.

§Includes 1 case of unknown age

Japan, Miyagi Prefecture

REGISTRATION AREA

The Miyagi Prefectural Cancer Registry covers Miyagi Prefecture, which is located in northern Japan and flanked to the east by the Pacific Ocean. In 2005, the population was 2.4 million and about 69% of employed residents worked in sales and service, 23% in manufacturing and construction, and 5% in agriculture.

CANCER CARE FACILITIES

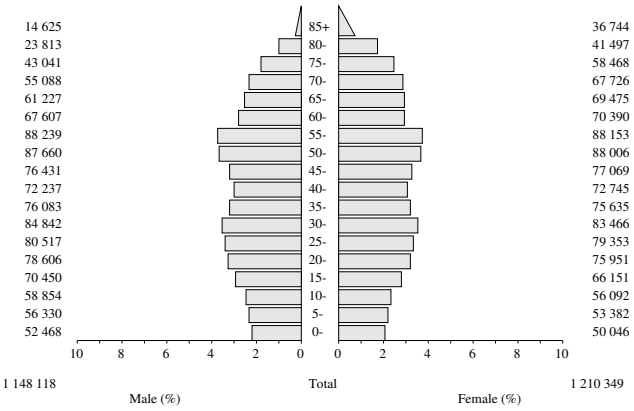
The prefecture has seven designated cancer care hospitals certified by the Japanese Ministry of Health, Labour, and Welfare; five of these are located in the prefectural capital of Sendai and the surrounding area. Outside of the Sendai area, the prefecture is divided into six health care districts, and several core general hospitals in each district also provide cancer diagnostic and treatment services.

REGISTRY STRUCTURE AND METHODS

The registry began operations in 1959 and has been based in the Miyagi Cancer Society since 1976. The prefectural government provides grants for cancer registration and the Miyagi Cancer Society also supports the registry financially. The registry is staffed by a part-time physician and three full-time registrars. All registry work is the responsibility of the Registry Committee, which is made up of representatives of the Miyagi Medical Association, the designated cancer care hospitals, the prefectural government, and the Miyagi Cancer Society. Reporting is voluntary, and registry staff members also collect data actively, visiting 10–20 hospitals annually to abstract data.

INTERPRETING THE RESULTS

Screening programmes for gastric, colorectal, lung, breast, and cervical cancers are provided by municipalities and in workplaces. The 2007 Comprehensive Survey of Living Conditions found that participation rates in these screening programmes were approximately 30–40%, which was relatively high compared with rates in other prefectures. During 2000–2006 most municipalities initiated prostate cancer screening programmes using prostate-specific antigen (PSA) testing.



USE OF THE DATA

The registry provides descriptive data on the incidence of cancer, the extent of disease, and survival rates, and registry data have also been used in a variety of epidemiological research projects, including follow-ups of large-scale cohort studies and evaluations of screening programmes.

Japan, Nagasaki Prefecture

REGISTRATION AREA

The Nagasaki Prefectural Cancer Registry covers Nagasaki Prefecture, on the western tip of the Japanese archipelago. A third of the prefecture's population lives in the city of Nagasaki on the island of Kyushu, where shipbuilding is one of the primary industries. The prefecture also has 55 smaller inhabited islands, whose residents account for 9% of the total prefectural population. More than 60% of the prefecture's residents work in the service and retail/restaurant industries, and 12% work in manufacturing (including shipbuilding).

CANCER CARE FACILITIES

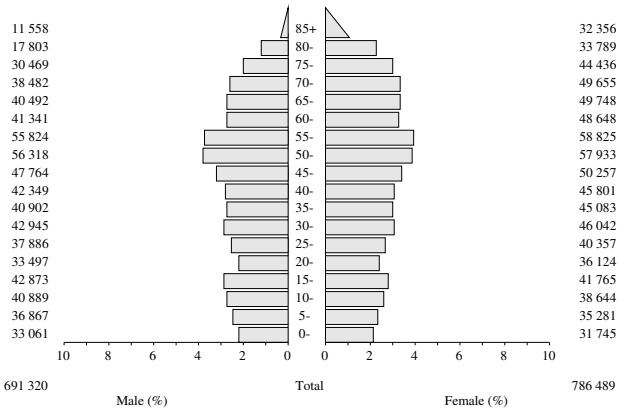
There are six cancer care hospitals with radiotherapy facilities designated by the Japanese government and six other hospitals (two of which have radiotherapy facilities) that treat more than 100 cancer cases annually. These hospitals are concentrated in the cities of Nagasaki and Sasebo, and 70% of cancer patients in the prefecture are treated in these cities.

REGISTRY STRUCTURE AND METHODS

The central registry office is located in the Radiation Effects Research Foundation's Department of Epidemiology and is staffed by a physician and nine full-time staff members, who are prefectural government employees. Incidence data are collected mainly by abstraction from medical records and pathology reports. Data on cancer cases detected in screening programmes are also obtained. The registry also collects all death certificates within the prefecture, to update the vital status of the registered cases.

INTERPRETING THE RESULTS

Hepatitis C virus and human T-cell lymphotropic virus type 1 (HTLV-1) infections are endemic in Nagasaki Prefecture, and these affect the incidence of hepatocellular carcinoma and adult T-cell leukaemia, respectively. The incidence of prostate cancer has been increasing due to increased opportunistic prostate-specific antigen (PSA) testing since 2003. Many atomic bomb survivors still live in Nagasaki, and the effects of atomic bomb radiation on cancer incidence persist.



USE OF THE DATA

The registry publishes annual reports on cancer incidence, mortality, and survival in Nagasaki Prefecture and participates in a project to estimate nationwide cancer incidence in Japan. Registry data are used for research into the association between radiation exposure and cancer incidence, and are also used by the government to design medical projects and cancer screening assessments.

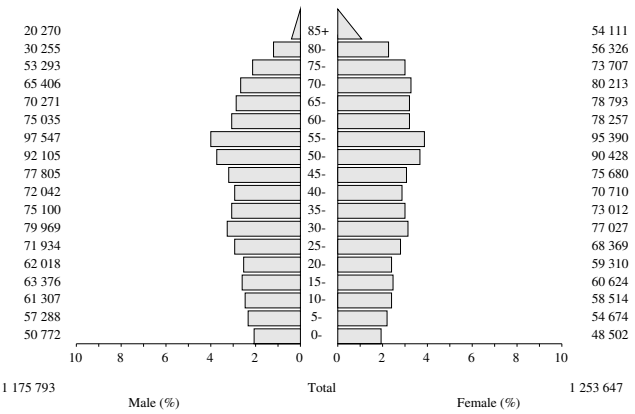
Japan, Niigata Prefecture

REGISTRATION AREA
The Niigata Prefectural Cancer Registry covers Niigata Prefecture, which is located on the coast of the Sea of Japan and is about 300 km north of Tokyo. The prefecture has a population of about 2.5 million and is known for the cultivation of rice, its heavy snowfalls, and its natural beauty.



CANCER CARE FACILITIES
The prefecture has nine hospitals with radiotherapy facilities.

REGISTRY STRUCTURE AND METHODS
The registry was established in 1991 by the prefectural government, in cooperation with the Niigata Medical Association, to collect cancer information and help establish cancer control programmes in Niigata. The registry follows the standard Japanese cancer registry system. Cancer registration forms are submitted voluntarily to the Niigata Medical Association by hospitals and clinics, and are then transferred to the Niigata Cancer Center Hospital. Data from screening programmes are obtained from the Niigata Association for Cancer Prevention.

USE OF THE DATA
The registry has published an annual online report since 1991 and provides more detailed data to medical researchers. Registry data are also used to perform quality control for screening programmes.

Japan, Niigata Prefecture (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION
Provided by the Japanese Center for Cancer Control and Information Services, the Japanese National Cancer Center, and the Japanese National Institute of Population and Social Security Research, based on estimates interpolated and extrapolated from 2001 and 2005 census data.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

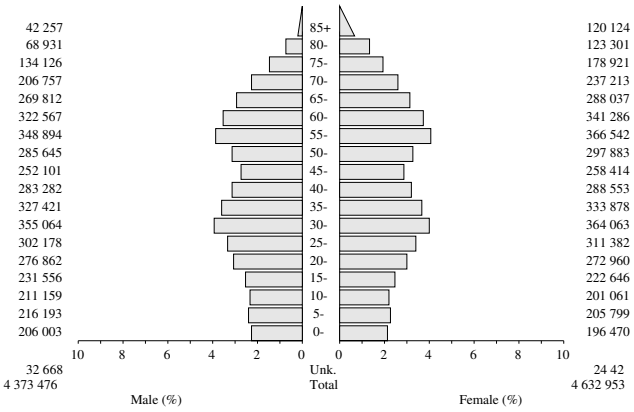
Japan, Osaka Prefecture

REGISTRATION AREA

The Osaka Cancer Registry (OCR) covers Osaka Prefecture in central Japan. The prefecture has the second smallest area (1894 km^2) but the second highest population density (4655 residents/km^2) of Japan's 47 prefectures. In 2005, the population was 8.8 million (98% Japanese, 1.3% Korean, and 0.3% Chinese). About 26.2% of workers are employed in industry, 70.7% in commerce, and 0.6% in agriculture.

REGISTRY STRUCTURE AND METHODS

The OCR has been operating, in cooperation with the Osaka Prefectural Health and Medical Department (OPHMD), the Osaka Medical Association (OMA), and the Osaka Medical Center for Cancer and Cardiovascular Diseases (OMCCD), since 1962. The central registry is located within the OMCCD's Center for Cancer Control and Statistics. The OMA asks all medical institutions in the prefecture to submit reports when cancer cases are diagnosed, and these reports are transferred monthly from the OMA to the central registry. Data from resident death certificates mentioning cancer are also obtained (through the OPHMD). To evaluate cancer survival in the prefecture, the registry has progressively undertaken active follow-up to determine vital status. High-quality survival data are available for patients diagnosed within the prefecture excluding the capital city of Osaka since 1975, and for all patients diagnosed within the prefecture since 1993. The proportion of cases that are lost to follow-up has been 1–2% at 5 years after diagnosis.



USE OF THE DATA

The registry publishes annual reports on cancer incidence, treatment statistics, and survival. Summary statistics are also available in English from the OMCCD's website (http://www.mc.pref.osaka.jp/ocr_e/index.html).

Japan, Saga Prefecture

REGISTRATION AREA

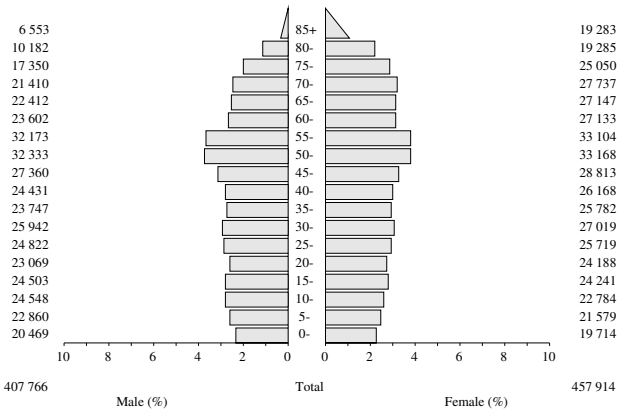
The Saga Prefectural Cancer Registry covers Saga Prefecture, which is located in southern Japan and has an area of 2439.65 km^2.

REGISTRY STRUCTURE AND METHODS

The Saga Cancer Survey was initiated in 1973 by the prefectural government in cooperation with the Saga Medical Association and was redesigned as the population-based Saga Cancer Registry in 1984. The registry has been located within the Saga General Health Association since 1998, and the prefectural government's Health and Welfare Head Office provides financial support. Case finding and data collection are carried out passively. The registry asks all medical institutions to voluntarily submit cancer case reports to the registry. Death certificate information from all local health authorities is transferred from the prefectural government to the registry monthly. Registry staff members also visit major hospitals to collect information on cancer cases. Resident case reports are exchanged between Saga and the neighbouring prefectures of Nagasaki and Fukuoka. Since 1992, all registered cases are coded using a unique automated system. Duplicate entries are identified through automatic linking of patient-related data. Reports of possible multiple primary tumours are carefully reviewed based on tumour site, histological type, and date of diagnosis. In 2011, a national standardized database system for regional cancer registration was established.

INTERPRETING THE RESULTS

The most striking cancer trend in Saga Prefecture is the extremely high mortality rate associated with liver cancer. Although much effort has been made to improve the accuracy and completeness of the registry's data, complete follow-up and detailed analysis of prognosis have not been performed.



USE OF THE DATA

The registry disseminates information on the nature and extent of the cancer burden in Saga Prefecture and provides statistical support to the prefecture's Cancer Prevention Project. The registry publishes an annual report on cancer incidence and mortality, and registry data have been used in several epidemiological studies.

Republic of Korea

REGISTRATION AREA

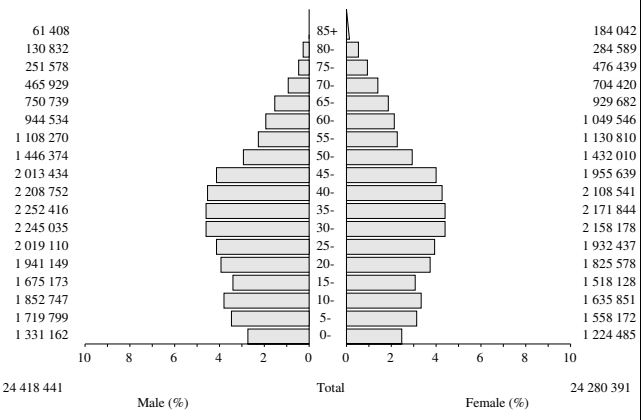
The Korea Central Cancer Registry (KCCR) covers the Republic of Korea in East Asia. In 2005, the population was 4.8 million, with 9.1% aged more than 65 years. The country's population density (493 residents/ km^2) is one of the highest in the world. Due to rapid urbanization, 90% of the population is classified as urban. Most residents are ethnic Koreans, and the national language is Korean.

CANCER CARE FACILITIES

All residents are covered by the National Health Insurance system, and national cancer control programmes have been in place since 1996. In 2005, 1000 of the country's 1500 teaching hospitals and general hospitals provided specialized cancer diagnostic and therapeutic services, and 2500 of the country's 26 000 private clinics provided general cancer care services.

REGISTRY STRUCTURE AND METHODS

The KCCR began as a hospital-based nationwide cancer registry, initiated by the Ministry of Health and Welfare in 1980. The registry is located within the Division of Cancer Registration and Surveillance at the Republic of Korea's National Cancer Center. There are also 11 population-based regional cancer registries in the country. The KCCR is responsible for collecting and managing nationwide cancer registry data, providing technical and financial support to the regional cancer registries, providing training for cancer registrars, and providing annual nationwide cancer statistics. Incident cancer cases are passively reported to the KCCR by more than 180 voluntarily participating hospitals, and medical records on potential cancer cases identified from the National Health Insurance data are actively reviewed. Vital status is obtained by linking the incidence records with death certificate data. The Cancer Act provides the legal basis for cancer registration. The KCCR is staffed by four full-time faculty members, a physician, a data manager, six statisticians, and eight cancer registrars. Financial support is provided by the government.



USE OF THE DATA

The KCCR publishes the *Annual Report of Cancer Statistics in Korea* and contributes to several scientific journal articles on cancer statistics and short-term predictions every year. Statistics tables and aggregated registry data are provided to policy-makers and cancer researchers upon request.

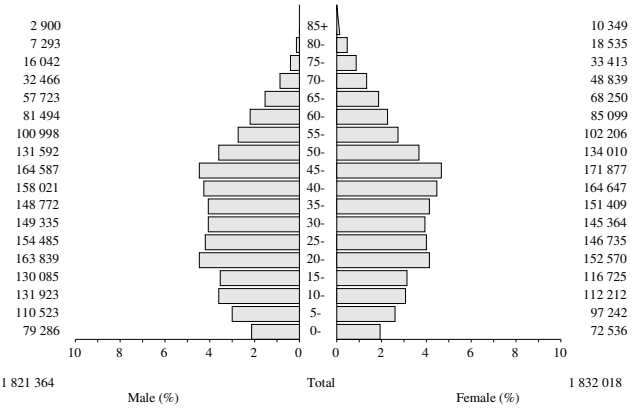
§Includes 5 cases of unknown age

Republic of Korea, Busan

REGISTRATION AREA
The Busan Cancer Registry (BSCR) covers the metropolitan city of Busan (with an area of 531.2 km^2) on the south-eastern tip of the Korean Peninsula. In 2005, the population of Busan was approximately 3.6 million (99.6% ethnic Korean).

CANCER CARE FACILITIES
In 2010, there were about 150 hospitals in Busan: four university hospitals, 20 cancer-reporting general hospitals, and about 120 other small and medium-sized hospitals.



REGISTRY STRUCTURE AND METHODS
The BSCR was established in 1995 in cooperation with the cancer centres of four university hospitals, and is administratively supported by the Busan Metropolitan Government and the city's medical association. The national cancer control programme provides financial support, and the Korea Central Cancer Registry (KCCR) provides technical support. There are 24 hospitals in Busan that report all inpatient cases and some outpatient cases directly to the KCCR, and the KCCR annually sends the BSCR all information on cancer patients with a Busan address at the time of diagnosis. Additional cancer cases from outpatient clinics are identified from the records of hospitals' anatomical pathology, diagnostic radiology, and radiation oncology departments. An additional 120 small and medium-sized hospitals cooperate with the BSCR. Two part-time medical officers visit these hospitals, collect the medical records of newly diagnosed cancer patients, and register the cases. These registrations are then reviewed by other registry personnel.

INTERPRETING THE RESULTS
There are organized screening programmes for breast, cervical, colorectal, gastric, and liver cancers.

USE OF THE DATA
The BSCR holds an annual conference to report and discuss cancer registration activities in Busan. The registry also publishes a biennial report that provides basic statistics on cancer incidence that may be helpful for the evaluation of local cancer management programmes.

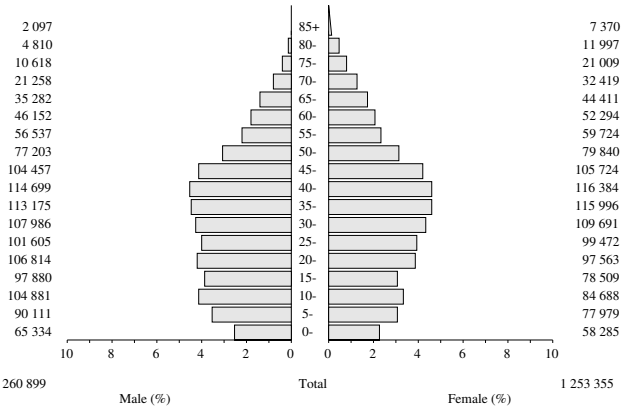
Republic of Korea, Daegu

REGISTRATION AREA

The Daegu Cancer Registry (DCR) covers the urban, extended metropolitan city of Daegu in the south-east of the Republic of Korea. The city has an area of 885.56 km^2 and is surrounded by mountains, which provide a well-defined geographical border. The climate is characterized by large temperature differences between summer and winter.

REGISTRY STRUCTURE AND METHODS



The DCR has been registering incident cancer cases since 1997. It is located in the Daegu-Gyeongbuk Regional Cancer Center within Kyungpook National University Hospital and is staffed by two physicians and a medical records technician. The DCR works closely with the Korea Central Cancer Registry (KCCR), which classifies all malignant neoplasms according to ICD-O-3. To improve the completeness of the nationwide data, several information sources are used: national death certification data from Statistics Korea, medical claims data from the National Health Insurance Corporation (NHIC), and additional medical record reviews. The list of KCCR-registered cases and a list of cancer cases from claims made through the NHIC within each region are sent to the regional registries to find missing cases. The regional registries collect data both passively and actively. The KCCR also sends the DCR lists of patients with suspected cancers in non-KCCR-registered Daegu hospitals, and the DCR medical records technician visits each non-registered hospital to identify cancer cases in the medical records. The KCCR collects reports from KCCR-registered hospitals directly and receives data on patients in non-registered hospitals from the DCR.

A database of cancer patients in Daegu is compiled by the KCCR (after checking for duplicates) and sent to the DCR. The DCR then uses these data to determine annual cancer incidence rates in Daegu. The DCR also records vital status when the information is available, for example from medical records, death certificates, or official cancer mortality data.

Republic of Korea, Daejeon

REGISTRATION AREA

The Daejeon Cancer Registry (DJCR) covers the metropolitan city of Daejeon in the centre of the Republic of Korea, 167.3 km from Seoul, 294 km from Busan, and 169 km from Gwangju. The city originally developed from farms and houses among the hillsides and valleys of the four mountains that surround Daejeon and along the three streams that run through it. Daejeon has an area of 540 km^2 and is the fifth largest city in the Republic of Korea, with a population of 1.5 million in 2007.

CANCER CARE FACILITIES

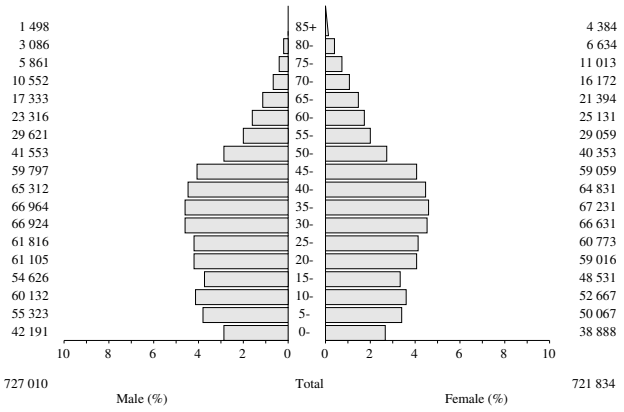
Both the public and private sectors provide cancer-related services in this region. In 2007, secondary and tertiary medical care was provided by nine general hospitals and 20 other hospitals. The DJCR cooperates with six hospitals that also participate in the national registry, and with many hospitals that do not.

REGISTRY STRUCTURE AND METHODS

The DJCR has been in operation since 1998. It is located in the Daejeon Regional Cancer Center within Chungnam National University Hospital and is staffed by a physician and three full-time registrars. The DJCR is responsible for collecting, analysing, and managing Daejeon cancer statistics and for analysing and summarizing data from Daejeon cancer registries. The data sources used to estimate cancer incidence in Daejeon are the DJCR database, the Korea Central Cancer Registry (KCCR) database, additional medical record reviews, and cancer mortality data from Statistics Korea – for identifying death-certificate-only (DCO) cases.

INTERPRETING THE RESULTS

In an effort to improve the quality of the KCCR data, an evaluation of data completeness was conducted for the cases diagnosed during 1999–2007, using the flow method developed by Bullard et al. (2000).



USE OF THE DATA

The registry publishes an annual report on cancer incidence, highlighting trends and changes. Special studies of cancer survival are also carried out using registry data, and registry data are essential for evaluating various cancer control programmes in Daejeon, including the National Cancer Screening Program.

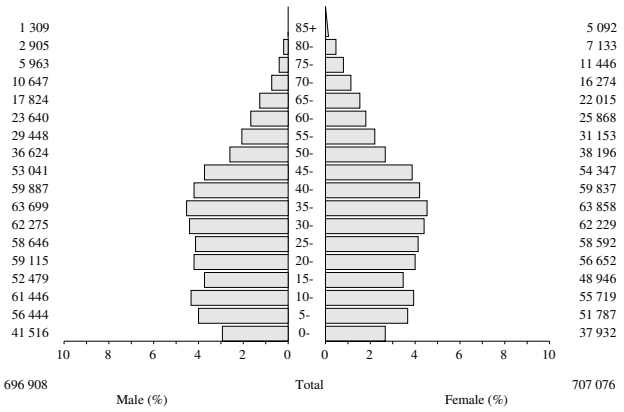
Republic of Korea, Gwangju

REGISTRATION AREA
The Gwangju Cancer Registry covers the metropolitan city of Gwangju near the south-western tip of the Korean Peninsula. The city has a population of 1.4 million and is the economic, educational, and cultural centre of the mainly rural surrounding provinces. There is some manufacturing in the city, including an automobile assembly plant, but the majority of Gwangju's workforce is employed in the service industry.

CANCER CARE FACILITIES
In 2007, the city had five referral hospitals (with facilities for radiotherapy, chemotherapy, and/or cancer surgery) and 70 other hospitals.



REGISTRY STRUCTURE AND METHODS
The registry was established in 1997. It is staffed by a director, part-time medical personnel, and three full-time registrars. The registry has a management committee composed of directors and oncologists from major hospitals and the chief of the city's health department. There is also a practical committee composed of hospital medical record keepers, to handle the practical details of cancer registration. The majority of the case information is linked to the Korea Central Cancer Registry (KCCR), which receives data from teaching hospitals throughout the country. Medical insurance claims data are also used, particularly for cases seen in non-teaching hospitals. Pathology reports, outpatient department reports, and radiation oncology records are also examined for supplemental information. The registrar reviews all information obtained from hospital visits and medical record checks, and the verified cases are then registered. Data obtained from outside sources are reviewed with the collaboration of the Republic of Korea's National Cancer Center and other regional cancer registries in the country. Death certificate data are obtained from Statistics Korea and matched against medical records.

INTERPRETING THE RESULTS
The medical practice of thyroid cancer screening increased during 2003–2007. There were no other changes in any factors that may have influenced incidence rates during the period.

USE OF THE DATA
The registry publishes an annual report on cancer incidence and other statistics, which are recognized as official public data of Gwangju Metropolitan City. The registry also submits an annual report to the municipal government.

Republic of Korea, Incheon

REGISTRATION AREA

The Incheon Cancer Registry (ICR) covers the metropolitan city of Incheon, which is located on the western coast of the Korean Peninsula, with the sea to the west and metropolitan Seoul to the east. Incheon is the third largest city in the Republic of Korea, with a population of about 2.8 million in 2010 (98.2% ethnic Korean).

CANCER CARE FACILITIES

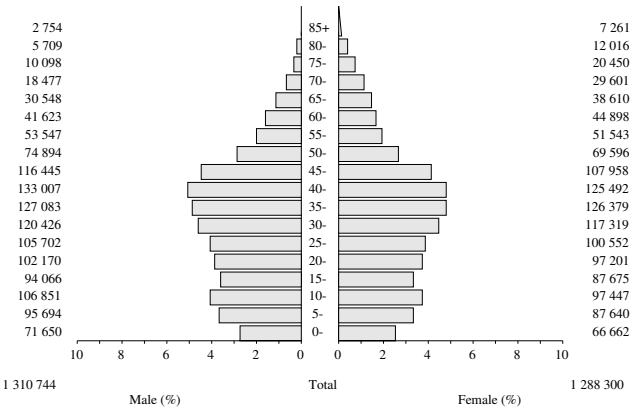
There are more than 100 medical institutions in Incheon, including three university hospitals offering full cancer diagnostic and treatment services. Two other hospitals have full cancer treatment facilities, 10 provide chemotherapy, three provide radiotherapy, and 49 perform cancer surgery.

REGISTRY STRUCTURE AND METHODS

The ICR was established in 1997 by Inha University in collaboration with the Korea Central Cancer Registry (KCCR). The ICR's primary data source is registry files from the KCCR, which the national registry receives from each of the country's regional cancer registries (including the ICR), allowing the ICR to register resident cases diagnosed within Incheon and outside of Incheon. The second major data source is non-KCCR-registered hospitals in Incheon. Other sources are health insurance documents (such as medical insurance claims) and death records from Statistics Korea. Follow-up information is obtained primarily by passive methods.

INTERPRETING THE RESULTS

National cancer screening programmes have been established for gastric, liver, cervical, colon, and breast cancers. The incidence rate of cervical cancer has decreased very rapidly, whereas the incidence rates of breast and thyroid cancers have increased.



USE OF THE DATA

The ICR annually reports cancer incidence by site, sex, and age (excluding extent of disease and survival) to the government. Policy-makers use regional cancer registry data, including ICR data, for developing health services and laws.

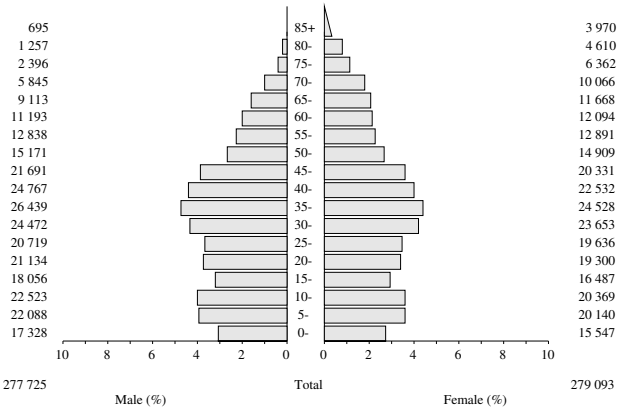
Republic of Korea, Jejudo

REGISTRATION AREA

The Jejudo Cancer Registry (JCR) covers the population of Jeju Province (also called Jejudo) off the southern tip of the Korean Peninsula. Jeju is the nation's largest island, with a total area of 1848 km^2. The mean annual temperature is 16 °C, and the mean annual rainfall is about 1158 mm. Jeju is known within the country as the clean island because it has no industrial factories creating pollution.

CANCER CARE FACILITIES

In 2005, the city had two general hospitals and four other hospitals, for a total of 1625 hospital beds. Two traditional medicine hospitals also provide palliative care to cancer patients.



REGISTRY STRUCTURE AND METHODS

The JCR is located in the Jeju Regional Cancer Center. It uses several information sources, and about 87% of the JCR data are registered through the Korea Central Cancer Registry (KCCR), which operates by voluntary reporting from teaching hospitals throughout the country. The second most important information source is active case finding by the registrars, who visit about 81% of potential cancer patients who make insurance claims related to cancer to the National Health Insurance Corporation. Insurance claims data are also a good source for tracking cases notified by death certificate only. The JCR's third most important information source is death certificates, which allow the registry to determine the vital status of previously registered cases and to register death-certificate-only (DCO) cases. Death certificates provided by Statistics Korea cover all deaths occurring in the country and include the full national resident registration number issued to every citizen at birth. The quality of death certificates in Jeju Province is good; about 98% are medically certified. The use of both health insurance data and mortality data enhances the completeness of registration. The JCR evaluates the validity of its data using the IARC-CHECK program and re-abstracts medical records to correct any errors.

Republic of Korea, Seoul

REGISTRATION AREA

The Seoul Cancer Registry (SCR) covers the metropolitan city of Seoul, the capital of the Republic of Korea. In 2010, the population was 9.8 million, about 20% of the national population.

CANCER CARE FACILITIES

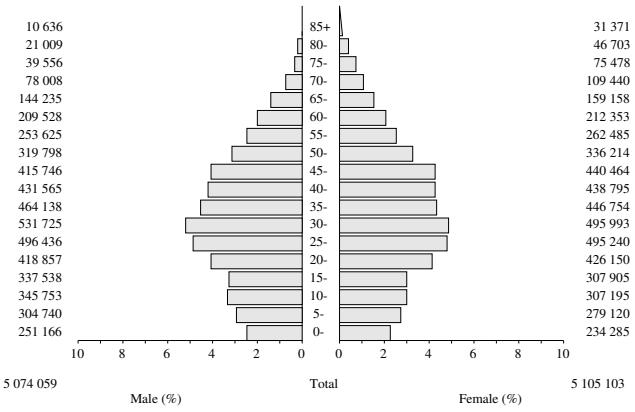
In 2009, there were 59 general hospitals and 161 other hospitals in Seoul. There were also 7197 clinics and 25 community health centres, but cancer is rarely diagnosed in these facilities. There were 3334 clinics and hospitals practising traditional medicine. More than 90% of cancers occurring in Seoul residents are treated within Seoul.

REGISTRY STRUCTURE AND METHODS

The SCR was established in 1991. It was located in Seoul National University College of Medicine's Department of Preventive Medicine until 2008, when it was moved to the Republic of Korea's National Cancer Center. The SCR uses several information sources, and about 90% of SCR data are registered through the Korea Central Cancer Registry (KCCR), which operates by voluntary reporting from more than 180 hospitals throughout the country. The second most important information source is active medical record reviews performed for potential cases identified from national health insurance data. The third most important information source is death certificates, which allow the registry to determine the vital status of previously registered cases and to register death-certificate-only (DCO) cases. The quality of death certificates in Seoul is good; in 2007, 99.6% were medically certified.

INTERPRETING THE RESULTS

In 1996, the national government initiated its first comprehensive 10-year plan for cancer control. As part of the plan, the National Cancer Screening Program (administered by the Ministry of Health and Welfare) was established in 1999 to provide free screening for gastric, breast, and cervical cancers. There has been a sharp increase in the incidence of thyroid cancer, but this increase may reflect improved diagnostic techniques rather than a true increase in occurrence.



USE OF THE DATA

SCR data have been used for health services planning and epidemiological research. Incidence tables containing registry data are published annually, as part of the *Annual Report of Cancer Statistics in Korea*.

§Includes 1 case of unknown age

Republic of Korea, Ulsan

REGISTRATION AREA

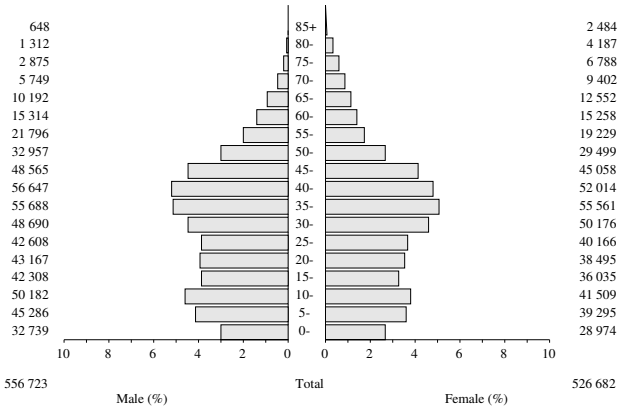
The Ulsan Cancer Registry (UCR) covers the metropolitan city of Ulsan, a port city in the south-east of the Republic of Korea. In 2009, the population was 1.1 million, with about 83% of residents living in urban areas. The mean annual temperature is 14 °C, and the mean annual rainfall is 1161 mm. Ulsan has rapidly become an industrialized city and accounts for 15.6% of the country's manufacturing industry.

CANCER CARE FACILITIES

All residents are covered by the National Health Insurance Plan. In 2010, Ulsan had 1510 private clinics and 78 hospitals: one university general hospital, three other general hospitals, 67 smaller hospitals, four dental hospitals, and three traditional medicine hospitals. The university hospital provides cancer surgery, chemotherapy, and radiotherapy services.

REGISTRY STRUCTURE AND METHODS

The UCR is located in Ulsan University Hospital's Department of Occupational and Environmental Medicine and is staffed by three part-time physicians and one full-time registrar. Approximately 79% of UCR data are registered through the Korea Central Cancer Registry (KCCR), which identifies incident cancer cases through a nationwide hospital-based cancer registration system that covers all general hospitals in the country. The second most important information source is medical claims data from the National Health Insurance Corporation. The third most important information source is death certificates (from Statistics Korea), which cover all deaths that occur in the Republic of Korea and include the full national resident registration number (RRN) issued to every citizen at birth. The RRN is also helpful for tracking cases notified by death certificate only. Several additional data sources, such as records from pathology laboratories and radiotherapy departments, also help the registry to identify unregistered cases. The UCR evaluates the validity of its data using the IARC-CHECK program and re-abstracts medical records to correct any errors.



USE OF THE DATA

The UCR publishes an annual report on cancer incidence and mortality in Ulsan. Registry data have been used in several epidemiological studies on primary, secondary, and tertiary cancer prevention.

Kuwait

REGISTRATION AREA

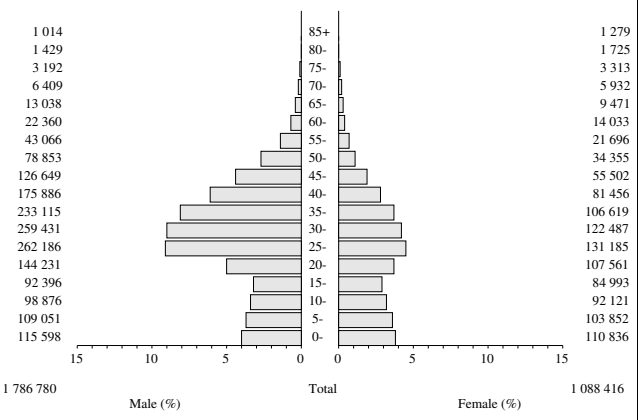
The Kuwait Cancer Registry (KCR) covers the entire country of Kuwait. In 2011, the population was 3.6 million: 32% Kuwaiti nationals and 68% non-Kuwaitis (expatriates). The expatriates living in Kuwait are a heterogeneous and transitory group; most are from either south-eastern Asia (38%) or Arab countries (28%). The population of Kuwait is relatively young; about 50% of Kuwaiti and 25% of non-Kuwaiti residents are aged less than 20 years.

CANCER CARE FACILITIES

Kuwait is divided into five health districts: Capital, Hawalli, Farwaniya, Ahmadi, and Al-Jahra. Each district has several primary/family health care clinics and a public general hospital. There are also several centralized specialist hospitals in the country, including the Kuwait Cancer Control Center (KCCC), which is Kuwait's only oncology centre.

REGISTRY STRUCTURE AND METHODS

The registry was established at Al-Sabah Hospital in 1971 to study the incidence and morphology of cancers among the Kuwaiti population. The registry later became a unit of the KCCC, which was established in 1982. Cancer notification is mandated by ministerial regulations. Cancer registration is comprehensive because almost all resident cases not initially diagnosed or treated at the KCCC (including those initially treated at other hospitals or abroad) are ultimately referred to the KCCC for further treatment or follow-up. The registry's information sources are case notes and reports from the pathology departments of the KCCC and other hospitals. Mortality data are obtained from the Health and Vital Statistics Division of the Kuwait Ministry of Health. All coding and data entry is carried out by registry employees. The registry is staffed by a consultant cancer epidemiologist, an administrator, three cancer registrars, and a secretary.



USE OF THE DATA

The registry publishes an annual report on cancer incidence, highlighting trends and changes. Registry data are used for research and for the planning and evaluation of cancer care facilities.

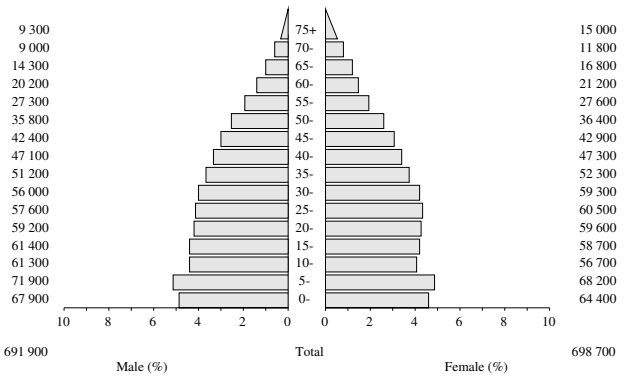
Malaysia, Penang

REGISTRATION AREA

The Penang Cancer Registry (PCR) covers the state of Penang in the north-west of Peninsular Malaysia. The state has a population of slightly more than 1 million and consists of an island and a strip of mainland, with a total land area of 1149 km^2. The island (about 300 km^2) is linked to the mainland by a 13.5 km bridge. Penang has five health districts: Timur Laut and Barat Daya on the island and Seberang Perai Utara, Seberang Perai Tengah, and Seberang Perai Selatan on the mainland. The population is 45% Chinese, 45% Malay, 10% Indian, and 0.4% of other ethnicities. Penang has a higher average economic attainment and per capita income than most other Malaysian states.

CANCER CARE FACILITIES

Penang serves as a hub for cancer care not only for its own residents but also for patients from nearby states (e.g. Kedah, Perlis, and Perak) and neighbouring countries (e.g. Indonesia).



REGISTRY STRUCTURE AND METHODS

The PCR was established in 1994 and was the first regional population-based registry in Malaysia. Registration is based primarily on voluntary notification. The registry records basic epidemiological and clinical data on all cancer cases diagnosed in Penang (regardless of citizenship, place of residence, or basis of diagnosis). However, only cases occurring in Penang residents (Malaysian citizens or permanent residents living in Penang at the time of diagnosis) are included in data analysis. The registry receives notifications (submitted using a standardized notification form) from all types of medical facilities in Penang. To ensure data completeness, active case finding and routine checks are carried out using discharge records from public and private hospitals and pathology records from public and private laboratories, supplemented by case detection from death records (provided by the state's registration department). Any cases identified from pathology or death records are checked against previously registered cases. Additional missing data for these cases are also obtained by review of the relevant hospital records.

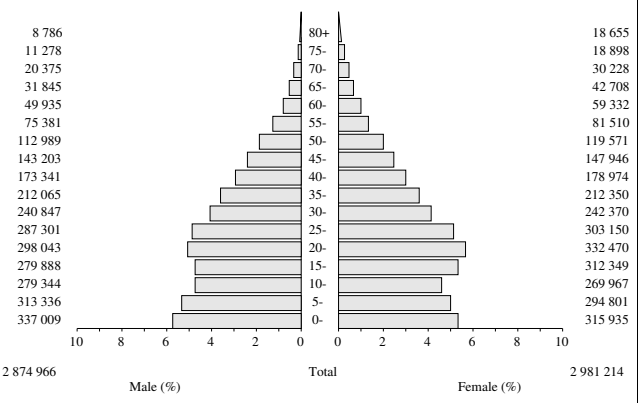
Philippines, Manila

REGISTRATION AREA

The Philippine Cancer Society-Manila Cancer Registry (PCS-MCR) covers the four major cities (Manila, Quezon, Pasay, and Caloocan) of the National Capital Region (NCR) of the Philippines (the country's major urban region). The registration area is 274.2 km^2, in 2007 had a population of 6.1 million, and is located in the south-western portion of the island of Luzon. The city of Manila proper is the capital of the Philippines and the country's main port, hub of commerce and trade, and seat of cultural and intellectual activities. Of all the cities in the Philippines, those covered by the PCS-MCR have had the longest exposure to a lifestyle typical of industrialized countries, and these four cities have consistently shown the highest cancer incidence rates in the country.

REGISTRY STRUCTURE AND METHODS

Registration began in 1983. The registry is staffed by seven trained employees, who conduct active case finding from a variety of data sources, mainly the 172 public and private hospitals in the NCR and the neighbouring province of Rizal. The PCS-MCR works in collaboration with the Philippine Department of Health-Rizal Cancer Registry (DOH-RCR), which covers the province of Rizal and the NCR cities and municipalities not covered by the PCS-MCR. The two registries cover a combined population of about 13.2 million. Hospital data sources include patients' main medical records as well as radiotherapy, haematology, nuclear medicine, and hospital tumour registry records. The PCS-MCR and the DOH-RCR use CanReg4 software, similar notification forms, and similar registration procedures, and they generally produce combined reports.



USE OF THE DATA

Two serial publications that include registry data are *Cancer in the Philippines* and *Philippine Cancer Facts and Estimates*. In collaboration with the German Cancer Research Center, the PCS-MCR has also published relative survival data for adult gastric, colorectal, liver, lung, breast, cervical, ovarian, and thyroid cancers and leukaemia (1993–2002 data) and for childhood leukaemia and lymphoma (1996–2005 data). Incidence maps have been generated in collaboration with the Finnish Cancer Registry. Registry data are used for programme planning and evaluation, cancer research, and training initiatives.

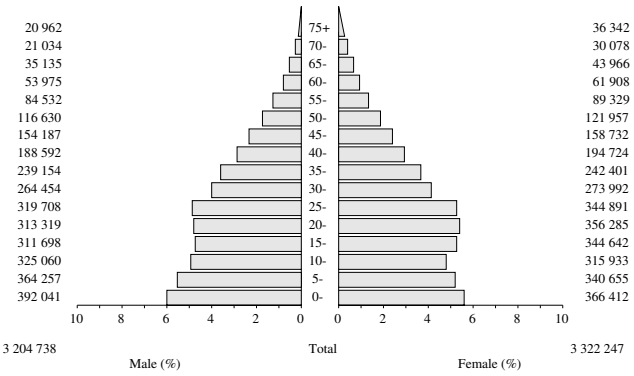
REGISTRATION AREA

The Department of Health-Rizal Cancer Registry (DOH-RCR) covers the 26 municipalities of the original province of Rizal in the Philippines. In 1975, 12 of these municipalities were incorporated into the National Capital Region (NCR), and 6 of the 12 have since become cities (in 1994–1999). Of the 14 municipalities that remained in Rizal, one has become a city (in 1999). The registration area is 1343 km^2 and in 2007 had a population of 7.2 million. Between the 2000 and 2007 censuses, the population increased by 22%.

REGISTRY STRUCTURE AND METHODS

The DOH-RCR was the country's first population-based cancer registry. From 1974 to 1979, data collection was entirely passive, with the registry relying on notifications submitted by physicians and hospitals. This approach proved to be unsatisfactory, so active registration began in 1980, with registry assistants trained to abstract data from hospital records and death certificates. The DOH-RCR is located in the city of Pasig at the Rizal Medical Center, which has fully funded the registry since 1975. The DOH-RCR is headed by a general surgeon and staffed by two full-time registry clerks and 10 part-time cancer registry research assistants (who work collaboratively with the Philippine Department of Health and the Philippine Cancer Society). The DOH-RCR also works in collaboration with the Philippine Cancer Society-Manila Cancer Registry (PCS-MCR) to send registry staff members to the 172 public and private hospitals in the NCR and Rizal. Hospital data sources include patients' main medical records as well as records from cancer centres; tumour clinics; and radiotherapy, haematology, nuclear medicine, and imaging facilities. The DOH-RCR and the PCS-MCR use CanReg4 software, similar notification forms, and similar registration procedures, and they generally produce combined reports.



USE OF THE DATA

Two serial publications that include registry data are *Cancer in the Philippines* and *Philippine Cancer Facts and Estimates*. In collaboration with the German Cancer Research Center, the DOH-RCR has also published relative survival data for adult gastric, colorectal, liver, lung, breast, cervical, ovarian, and thyroid cancers and leukaemia (1993–2002 data) and for childhood leukaemia and lymphoma (1996–2005 data). Incidence maps have been generated in collaboration with the Finnish Cancer Registry. Registry data are used for programme planning and evaluation and for cancer research.

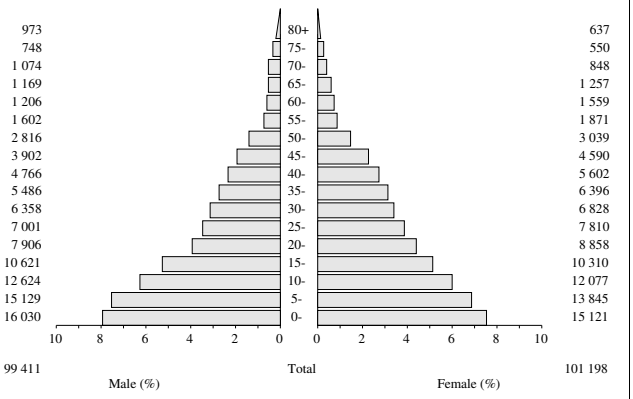
Qatar: Qatari

REGISTRATION AREA
The Qatar Cancer Registry (QCR) covers all cancer cases diagnosed in Qatar. In 2004, the population was 744 000. During 1997–2004, the population increased an average of 6.0% annually, compared with an annual average of 3.7% during 1986–1997. This rapid increase is attributed to an influx of workers due to the country's strong economy.

CANCER CARE FACILITIES
General health care is provided mainly by Hamad Medical Corporation, one of the leading specialized health care providers in the Gulf Arab states. Qatar's main cancer centre is located in Al Amal Hospital and is equipped with the latest therapeutic and diagnostic equipment.



REGISTRY STRUCTURE AND METHODS
The QCR was founded in 1989 as a hospital-based cancer registry in Hamad General Hospital. The registry was expanded to cover the entire country in 2003, and was relocated to Al Amal Hospital in 2004. The registry is staffed by a director, a data manager, and a full-time registrar, who are supported by a scientific board. The QCR routinely collects data from sources including general hospitals, private hospitals and clinics, specialized hospitals and centres, pathology and haematology laboratories, the Overseas Medical Offices Department of Qatar's Supreme Council of Health, and death registration offices. The registry is supported by Qatar's National Center for Cancer Care and Research, Hamad Medical Corporation, the Supreme Council of Health, and the Qatar Statistics Authority.

INTERPRETING THE RESULTS
It is difficult to estimate the number of cases that are undiagnosed or missed from registration, but the number of unreported cases is expected to decrease in future years with the implementation of electronic registration methods. Cancer mortality data for the Qatari population are fairly complete.

USE OF THE DATA
The registry regularly publishes reports on the distribution of various types of cancer by age and sex. These reports are used by health planners and policy-makers to assess cancer burden, allocate resources, and evaluate prevention and control activities. The QCR is also a regular contributor to the Gulf Cancer Consortium database.

Saudi Arabia, Riyadh: Saudi

REGISTRATION AREA

The National Saudi Cancer Registry (SCR) covers the entire country of Saudi Arabia, but the data included in this volume are for the province of Riyadh, which has an area of 412 000 km^2 (17% of the country's total area). The province is home to 25% of the national population, with an annual population growth rate of about 3.85%. In 2010, the population was 6.8 million (63.4% Saudis). The provincial and national capital is the city of Riyadh, which is divided into 15 municipal districts and is the 80th richest city in the world. The city has numerous educational, financial, agricultural, cultural, technical, and social organizations, as well as the world's largest all-female university (Princess Nora Bint Abdul Rahman University).

CANCER CARE FACILITIES

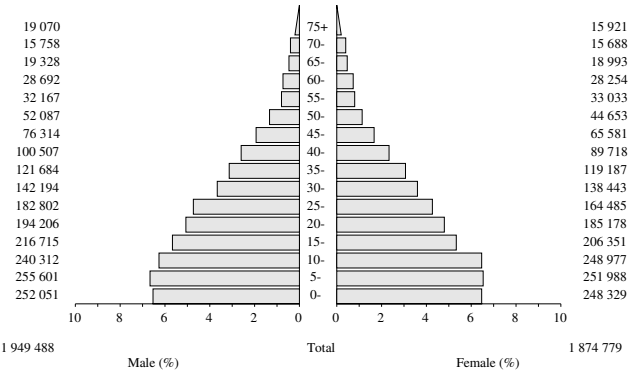
The health sector is highly developed. Health services are provided by government hospitals and supplemented by private hospitals. Residents have access to modern cancer centres offering a complete range of services. The government provides cancer treatment within major specialized tertiary care hospitals. The King Faisal Specialist Hospital and Research Centre (KFSH&RC) in Riyadh has the largest cancer facility in the Gulf region, providing high-quality surgery, chemotherapy, radiation, and palliative care. It treats approximately 30% of the country's overall cancers and 70% of paediatric cancers.

REGISTRY STRUCTURE AND METHODS

The SCR began registering cases in 1994, and is funded by the Ministry of Finance of Saudi Arabia. The main office is at the KFSH&RC, and there are 11 regional branches. The SCR uses multiple data sources, including death notifications and death certificates (since 2005). The registry has also performed extensive retrospective data collection for cancer deaths that occurred before 2005. Registrars actively collect cases from 295 hospitals and histopathology laboratories, and the SCR also receives notifications directly from hospital-based registries.

INTERPRETING THE RESULTS

Cancer screening is provided by some hospitals and charity organizations.



USE OF THE DATA

The SCR publishes an annual cancer incidence report. Registry data are also used for epidemiological studies, programme evaluation, and research projects.

Saudi Arabia, Riyadh: Saudi (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Provided by the Central Department of Statistics of the Saudi Arabian Ministry of Planning, based on the 2004 census, with an estimated 2.5% growth rate among Saudis.

NOTES ON THE DATA

*No official mortality data. High MV%. Low DCO rates.

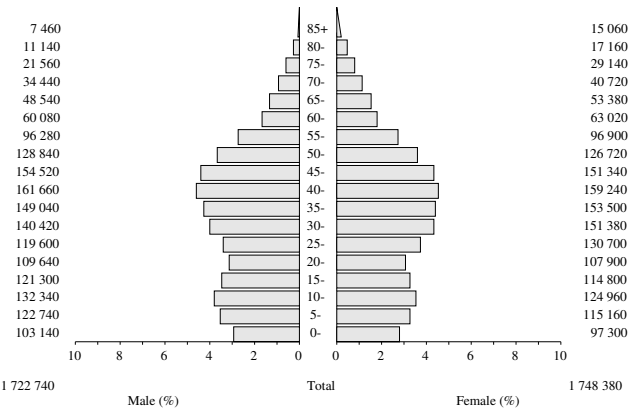
Singapore

REGISTRATION AREA
The Singapore Cancer Registry covers the country of Singapore. In 2010, the population was 5.1 million: 74.1% Chinese, 13.4% Malay, 9.2% Indian, and 3.3% of other ethnicities.

CANCER CARE FACILITIES
Primary health care is provided by 18 public outpatient clinics and 2384 private clinics. There are also seven public and seven private hospitals. Health care is paid for mainly by government subsidies, employment benefits, and personal savings (Medisave). There is also a basic medical insurance plan (MediShield) for catastrophic illnesses (including cancer) that covers all citizens and permanent residents.



REGISTRY STRUCTURE AND METHODS
The National Registry of Diseases Office (NRDO) was set up by the Ministry of Health Singapore to manage registry operations. The National Registry of Diseases Act of 2007 allows the NRDO to collect incidence data on selected diseases, and cancer notification became mandatory in 2009. Patient identifiers are encrypted before being added to the database. The registry receives pathology reports, hospital listings, notifications from practitioners, and death certificates. Registry coordinators verify each notification against hospital and clinic records, and interrater reliability is evaluated against an internal gold standard. The registry is staffed by eight employees: two nurse managers, two senior executives, a senior staff nurse, a staff nurse, and two management support staff members. Additional quality assurance, data management, and epidemiological staff members also support the registry.

INTERPRETING THE RESULTS
The registry used ICD-O-2 coding during 1993–2002 and switched to ICD-O-3 in 2003. Since 1998, the registry has also used the fourth edition of the *WHO Classification of Tumours of Haematopoietic and Lymphoid Tissues*. Organized screening was implemented for breast cancer in 2002, for cervical cancer in 2004, and for colorectal cancer in 2011.

USE OF THE DATA
The registry provides annual online reports on cancer incidence and publishes reports on incidence and survival every 5 years. The data are also used for the annual Singapore Burden of Disease Study, hospital audits, resource projections, and research. The statistics exclude in situ cancers and data on non-permanent residents.

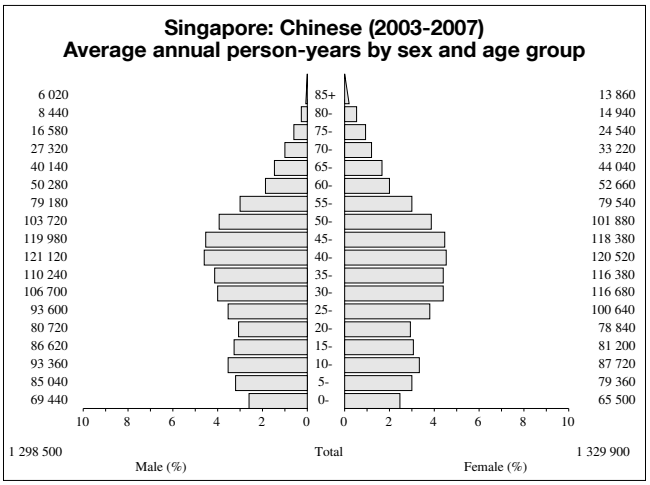
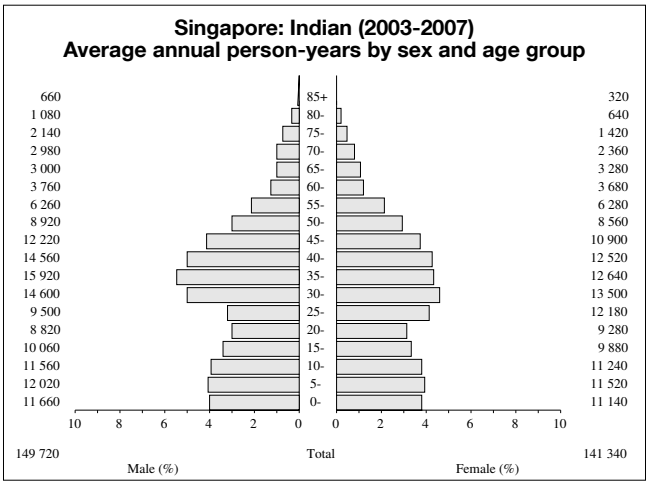
Singapore (2003-2007)
Average annual person-years by sex and age group



SOURCE OF POPULATION
Based on data provided to the Singapore Ministry of Health by the Singapore Department of Statistics (http://www.singstat.gov.sg/pubn/papers/people/cp-c2kapp.pdf), making allowances for births, deaths, and migration.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

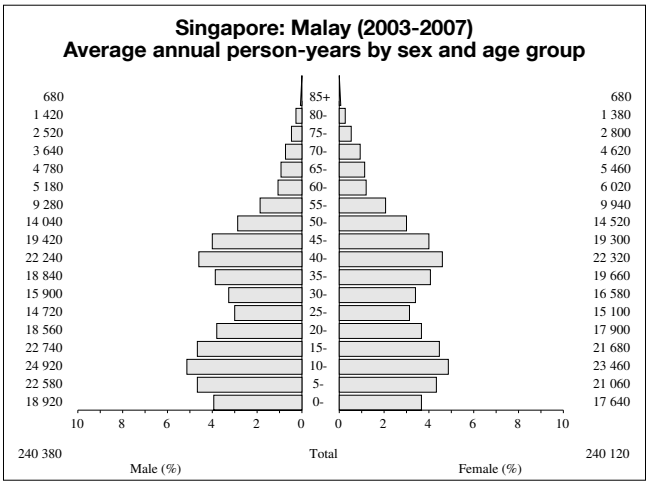
10 MAJOR CANCERS, ASR (WORLD) PER 100 000



Male		Female	
Trachea, bronchus and lung	41.1	Breast	57.8
Prostate	24.2	Colon	19.0
Colon	22.9	Trachea, bronchus and lung	16.3
Liver	17.4	Corpus uteri	11.7
Rectum	16.8	Rectum	9.5
Stomach	14.0	Ovary	9.0
Nasopharynx	10.9	Cervix uteri	8.9
Non-melanoma skin cancer	9.7	Stomach	7.1
Non-Hodgkin lymphoma	9.0	Non-melanoma skin cancer	6.6
Bladder	7.1	Thyroid	5.9
All sites	229.6	All sites	198.6

NOTES ON THE DATA: †C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

SINGAPORE: CHINESE
10 MAJOR CANCERS, ASR (WORLD) PER 100 000



Male		Female	
Trachea, bronchus and lung	44.7	Breast	59.2
Colon	25.6	Colon	20.7
Prostate	25.6	Trachea, bronchus and lung	17.6
Liver	19.0	Corpus uteri	12.0
Rectum	18.4	Rectum	10.4
Stomach	15.9	Cervix uteri	9.4
Nasopharynx	12.6	Ovary	9.1
Non-melanoma skin cancer	10.1	Stomach	7.8
Non-Hodgkin lymphoma	9.3	Non-melanoma skin cancer	7.0
Bladder	7.4	Thyroid	5.7
All sites	247.2	All sites	207.5

NOTES ON THE DATA: †C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

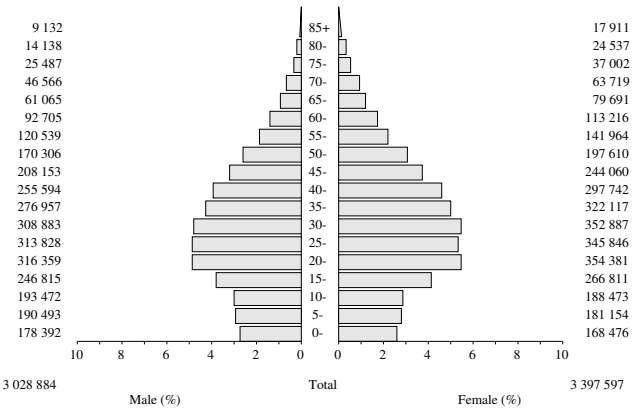
Thailand, Bangkok

REGISTRATION AREA

The Bangkok Cancer Registry covers the metropolis of Bangkok in the Chao Phraya River delta of central Thailand. Bangkok is the national capital and the country's centre of politics, economy, education, culture, and transportation. It is also one of the most important commercial centres in south-eastern Asia. The area has a tropical wet and dry climate, with long hours of sunshine and high temperatures and humidity. Bangkok is composed of 50 districts, with a total area of 1569 km^2.

CANCER CARE FACILITIES

The Bangkok Metropolitan Administration is the local authority responsible for residents' well-being, with some financial support from the central government. Nine of Thailand's 12 government cancer centres are located in Bangkok: the National Cancer Institute of Thailand, King Chulalongkorn Memorial Hospital, Siriraj Hospital, Ramathibodi Hospital, Phra Mongkutklao Hospital, the Queen Sirikit National Institute of Child Health, Rajavithi Hospital, Vajira Hospital, and Bhumibol Adulyadej Hospital. There are also three international private cancer centres: Bangkok Hospital, Bumrungrad International Hospital, and Samitivej Hospital. Bangkok has a physician-to-population ratio of 1:793, compared with 1:6237 in other parts of Thailand.



REGISTRY STRUCTURE AND METHODS

The registry collects information on all cancer cases in Bangkok and sends data on non-resident patients treated in Bangkok to other cancer registries. The registry is part of the National Cancer Institute of Thailand, which first established a population-based cancer registry for the metropolis of Bangkok in 1990. Data are collected both actively and passively from government cancer centres, university hospitals, government hospitals, private hospitals, pathology laboratories, and death certificates. All death certificates are matched against the registry database, and efforts are made to trace further information before registering any case as a death-certificate-only (DCO) case.

Thailand, Chiang Mai

REGISTRATION AREA

The Chiang Mai Cancer Registry covers the province of Chiang Mai in Thailand. About 82% of residents were born in the province; the rest are Thai nationals, Chinese, Lao, or Hilltribe peoples. Most residents (91.8%) are Buddhist, and the rest are mainly either Christian or Muslim.

CANCER CARE FACILITIES

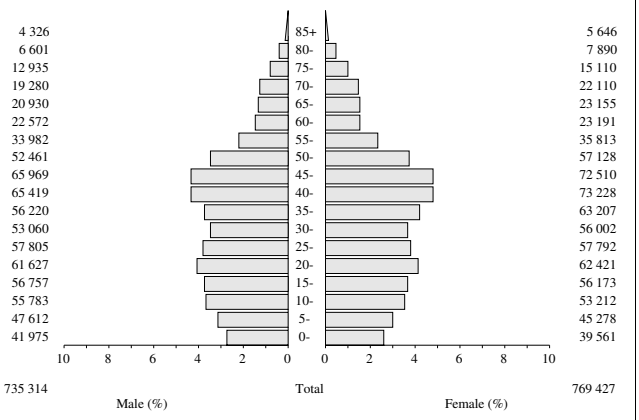
General health care is provided by the Chiang Mai Provincial Public Health Office through provincial and district hospitals. Cancer diagnostic services are available at most hospitals, but patients suspected to have cancer are typically referred by primary and secondary care facilities to the university hospital (Maharaj Nakorn Chiang Mai Hospital), which is the only hospital with full diagnostic and therapeutic facilities within the same institution, and the only hospital with radiotherapy equipment. There are about 6012 hospital beds and 1010 physicians in the province.

REGISTRY STRUCTURE AND METHODS

The registry has been population-based since 1983. It is located within the Maharaj Nakorn Chiang Mai Hospital and is fully supported by the Faculty of Medicine, Chiang Mai University. The registry is staffed by two part-time physicians, four full-time registrar nurses, and three practical nurses, and is supervised by the hospital's cancer committee. Data are collected actively from the university hospital, six government hospitals, 22 community hospitals, 12 private hospitals, and various medical clinics. Death certificates are provided by the Ministry of Public Health's Bureau of Policy and Strategy.

INTERPRETING THE RESULTS

The number of undiagnosed cancer cases is unknown, but the proportion is probably higher in rural areas. Because the Maharaj Nakorn Chiang Mai Hospital is the only university hospital in the area and has a full range of diagnostic facilities, it is unlikely that referred cases will be missed. There is an organized screening programme for cervical cancer, and there are occasional health education campaigns about common cancers in the region.



USE OF THE DATA

The registry has published annual reports since 1978, when it was a hospital-based registry. The registry also collaborates with the other Thai registries to report on national cancer incidence every 3–5 years.

Thailand, Chonburi

REGISTRATION AREA

The Chonburi Cancer Registry covers the province of Chonburi in eastern Thailand, which has an area of 4363 km^2 and includes the country's most popular beach, Pattaya. In 2005, the population was 562 000 males and 584 000 females. Most people work in the industrial sector, and some are fishermen.

CANCER CARE FACILITIES

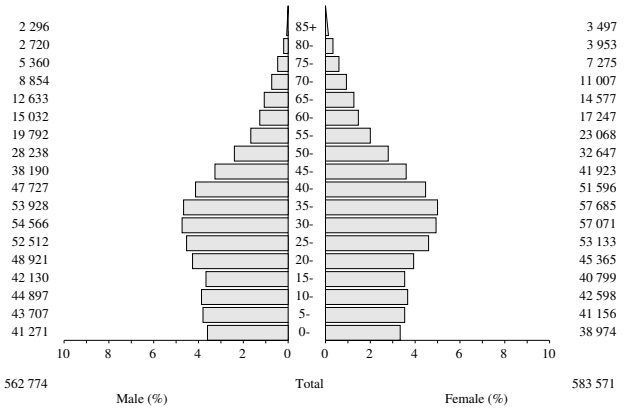
There are 26 hospitals in Chonburi, 10 of which provide cancer diagnostic services, surgery, and chemotherapy. The Chonburi Cancer Center (CCC) is the only institution in eastern Thailand that provides radiotherapy. Palliative care is provided in all hospitals. Patients suspected to have cancer are referred to the CCC, provincial hospitals, and private hospitals.

REGISTRY STRUCTURE AND METHODS

The registry is located within and funded by the CCC and is staffed by a part-time physician, a part-time expert consultant, a part-time nurse, and four full-time employees. Data collection is both passive and active. The registry collects cases from all Chonburi hospitals and the network of cancer registries in Thailand. Staff members visit the large hospitals to collect data, and community hospitals send notification forms to the registry. Cases are followed up through records matching with the Thai National Health Security Office's population database and all death certificates. When cancer is listed as the cause of death but no other information can be found, cases are categorized as death-certification-only (DCO) cases.

INTERPRETING THE RESULTS

The number of undiagnosed cancer cases is unknown, but the proportion is probably higher in rural areas. Because the CCC offers a full range of diagnostic and treatment facilities, few residents seek cancer care outside the province. Cervical cancer screening is available in all hospitals. Mammography, alpha-fetoprotein (AFP) testing, and prostate-specific antigen (PSA) testing are common in the large hospitals.



USE OF THE DATA

The registry publishes a report on cancer incidence and mortality in Chonburi every 5 years and has joined with other registries to report national statistics every 3 years. Registry data are used by the local health authority to evaluate the effectiveness of cancer prevention, screening, and treatment initiatives. The registry is also involved in epidemiological research on cancers that are common in the province.

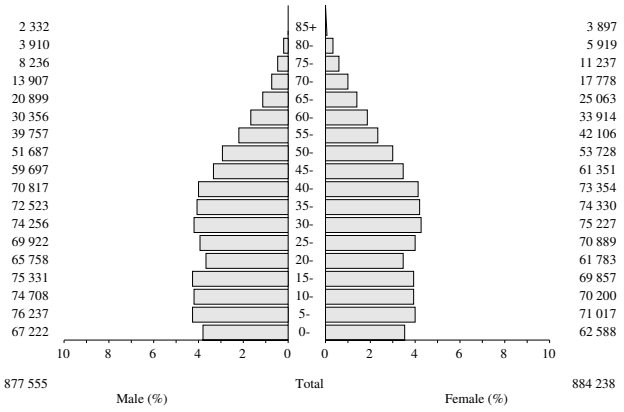
Thailand, Khon Kaen

REGISTRATION AREA

The Khon Kaen Cancer Registry covers the province of Khon Kaen in north-eastern Thailand. The province is 163 m above sea level, has an area of 10 886 km^2, and has a population of 1.7 million. It is bordered by the provinces of Loei, Nong Bua Lam Phu, and Udon Thani to the north; Kalasin and Maha Sarakham to the east; Buriram and Nakhon Ratchasima to the south; and Chaiyaphum and Phetchabun to the west. The climate is generally hot and dry, with a mean annual temperature of 28 °C and a mean annual rainfall of 1188 mm. The majority of the population is employed in rice farming.

CANCER CARE FACILITIES

Khon Kaen is divided into 26 health districts. The province's most important facility is Srinagarind Hospital (a 1000-bed university hospital), which is the largest referral centre in north-eastern Thailand. The hospital is well equipped and provides surgery, chemotherapy, and radiotherapy; immunotherapy and organ transplantation facilities are in development. The other institutions that provide data to the registry are the Khon Kaen Regional Hospital (with 867 beds), the Khon Kaen Central Hospital, two health promotion centres, two private hospitals, and 25 community hospitals. The physician-to-population ratio is about 1:3110.



REGISTRY STRUCTURE AND METHODS

The registry was established within the Faculty of Medicine, Khon Kaen University in 1985. It collects data from all care facilities in the province, by both active and passive methods. Data on Khon Kaen residents are extracted from hospitals; the medical charts of patients diagnosed with cancer are reviewed and cases are registered by cancer unit staff members. Death certificates are collected from the civil registration system. All data are verified, checked for duplication, coded, and entered using CanReg software. Questionable cases are traced back to the original information sources for clarification. All multiple primary cases are verified against the original records, and the physicians are consulted if necessary. Registered cases are followed up for vital status.

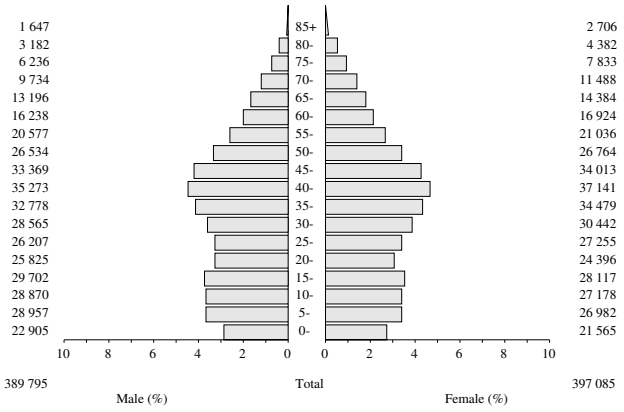
Thailand, Lampang

REGISTRATION AREA
The Lampang Cancer Registry covers the province of Lampang in northern Thailand.



REGISTRY STRUCTURE AND METHODS
The registry is located in Lampang Cancer Hospital. It uses passive methods of data collection from 21 information sources: cancer centres, general hospitals, community hospitals, private hospitals, university hospitals, the provincial public health service, and pathology laboratories. The data collected are registration number, name, residential address, date of birth, age, sex, date of diagnosis, site of cancer, histology, staging, extent of disease, method of diagnosis, treatment, date of last contact, and vital status. Primary site and histology are coded according to ICD-O-3. The registry uses the IARC rules (1990) for multiple primary tumours. Death certificates are obtained from the Thai Ministry of Public Health's Bureau of Policy and Strategy. All registered cases are passively followed up through record linkage with the Thai National Health Security Office's database. CanReg4 software is used for data entry and analysis.

INTERPRETING THE RESULTS
The registry's case ascertainment has been estimated to be more than 97% complete (Suwanrungruang et al., 2011). A national hepatitis B virus vaccination programme for children was started in 1992, and a national cervical cancer screening programme for women aged 35–54 years was launched in 1998. Other programmes, such as prostate-specific antigen (PSA) testing and screening for breast and colon cancers, have been established (although not nationwide) in provincial hospitals, university hospitals, cancer centres, and some private hospitals.

USE OF THE DATA
The registry publishes annual reports on hospital-based cancer registration and periodic reports on population-based cancer incidence, mortality, and survival. Registry data have been used in cancer research and by the local health authority for cancer control planning and the evaluation of cancer prevention, screening, and treatment initiatives.

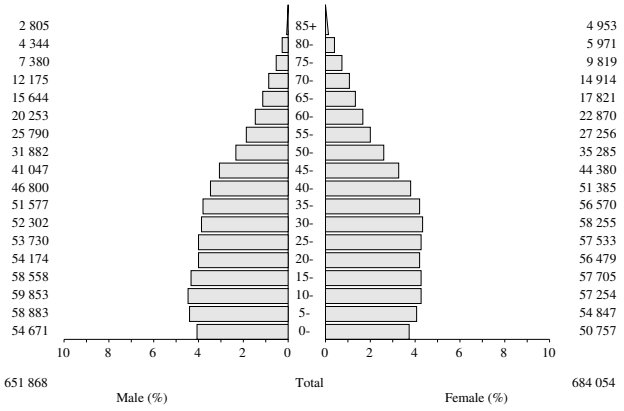
Thailand, Songkhla

REGISTRATION AREA
The Songkhla Cancer Registry covers the province of Songkhla in southern Thailand. In 2000, the population was 1.3 million (80% Buddhist, 20% Muslim or Christian). Two cities in the province, Songkhla (the capital) and Hat Yai (the economic centre of southern Thailand), have high proportions of ethnic Chinese residents compared with other Thai cities.

CANCER CARE FACILITIES
Government health care facilities include three hospitals (with a total of more than 500 beds), 13 community hospitals, and many community health centres. In urban areas, there are also private clinics and hospitals. Prince of Songkla University's (PSU's) Songklanagarind Hospital is the larger of the two hospitals in southern Thailand that provide radiotherapy services. Patients suspected to have cancer are referred to Songkhla Hospital, Hatyai Hospital, and Songklanagarind Hospital.



REGISTRY STRUCTURE AND METHODS
The registry is part of the PSU Cancer Centre, which has an advisory team of specialists in all major cancer fields. The registry is headed by a practising clinician and is staffed by two pathologists, a radiologist, an epidemiologist, two nurses, and eight support staff members. It uses active case finding from 23 sources: all hospitals in the province, the provincial health office, and the provincial population registration office. Death registration is relatively complete, but the recorded cause of death is not always accurate.

INTERPRETING THE RESULTS
The number of undiagnosed and unregistered cases is believed to be low. Some residents (particularly in remote areas) visit hospitals in the two nearby provinces, some never enter the health care system, and a few seek care in Bangkok. There were no screening programmes during the reporting period, and prostate-specific antigen (PSA) testing is not common.

USE OF THE DATA
Registry data are used by government, academic, and public institutions. The registry collaborates with the National Cancer Institute of Thailand and other registries to provide national cancer statistics, projections, and recommendations.

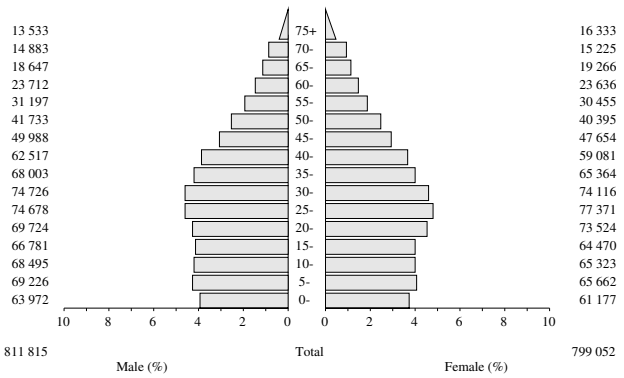
Turkey, Antalya

REGISTRATION AREA

The Antalya Cancer Registry covers Antalya Province on the Mediterranean coast of southern Turkey. In 2006, the population was 1.7 million, with 74.8% of residents living in urban areas. In recent years, Antalya has experienced the fastest rate of population growth in Turkey, due to internal migration. The majority religion is Islam. Regional income comes from trade, agriculture (particularly commercial production of flowers, vegetables, and fruit), tourism, and construction.

CANCER CARE FACILITIES

General health care is provided mainly by primary health centres and government hospitals, but the number of private hospitals and health centres has increased in recent years. Patients suspected to have cancer are generally referred by primary and secondary care facilities to the Mediterranean University Hospital and government hospitals in central Antalya.



REGISTRY STRUCTURE AND METHODS

The registry was established in 1995. It is staffed by a full-time public health specialist (a physician) and two full-time health workers (trained as cancer registrars). An additional 17 registrars are based in hospitals and clinics. The registry actively collects data from all hospitals and some clinics that provide cancer diagnostic and treatment services in the province. The information sources are 13 government hospitals, a government education–research hospital, two university hospitals, 17 private hospitals, a private radiotherapy clinic, three private pathology laboratories, two radiology imaging centres, several private health centres, and the Center for Early Diagnosis and Screening of Cancer. The registry staff members working in government and university hospitals review the hospital archives and the records of departments involved in cancer diagnosis to identify and abstract information on cases. The death registration system is incomplete, particularly in rural areas, and cause of death is often not stated or is simply listed as cardiorespiratory arrest. The registry uses ICD-O-3 for topography and histology coding and CanReg4 software for database management and data processing. The registry follows the *Middle East Cancer Consortium (MECC) Manual of Standards for Cancer Registration*.

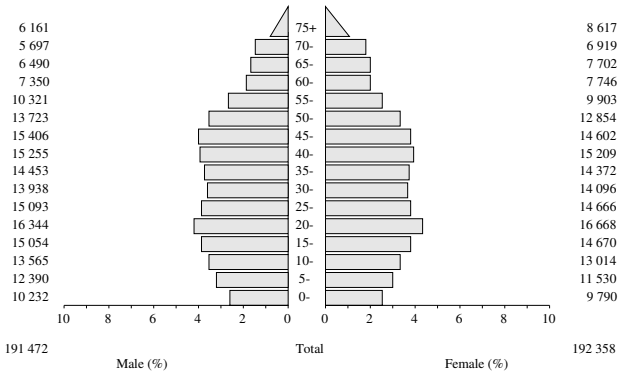
Turkey, Edirne

REGISTRATION AREA
The Edirne Cancer Registry covers Edirne Province in the region of Anatolia in western Turkey. Two thirds of residents live in urban areas, and the majority religion is Islam. Edirne's population is decreasing due to external emigration. Regional income comes from livestock, agriculture, tourism, and small industries.

CANCER CARE FACILITIES
General health care is provided mainly by primary health centres and government hospitals. Patients suspected to have cancer are generally referred by primary and secondary care facilities to Trakya University Hospital and government hospitals in central Edirne. Some residents receive cancer diagnostic and treatment services outside the province.



REGISTRY STRUCTURE AND METHODS
The registry is staffed by five full-time health workers, and an additional eight staff members are based in hospitals. The registry collects data from all hospitals and some clinics that provide cancer diagnostic and treatment services in the province. During 2004–2007, the registry used active case finding from six government hospitals, a university hospital, and four private hospitals. The death registration system is incomplete, particularly in rural areas.

INTERPRETING THE RESULTS
The number of undiagnosed cancer cases is unknown, but the proportion is probably higher among elderly residents in rural areas.

USE OF THE DATA
The registry publishes an annual report on cancer incidence, highlighting trends and changes.

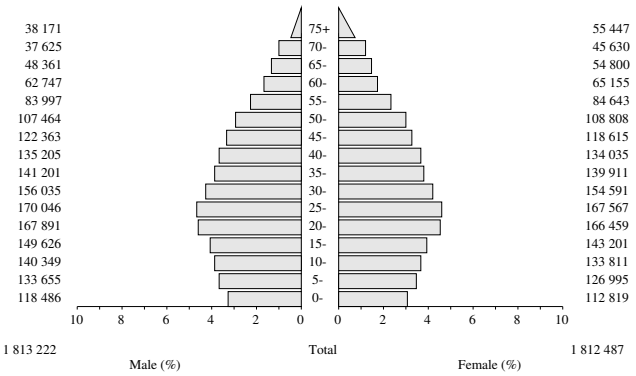
Turkey, İzmir

REGISTRATION AREA

The Izmir Cancer Registry (ICR) covers İzmir Province in the extreme west of Turkey, on the Aegean Sea coast. The province is divided into 30 districts. The provincial capital (the city of İzmir) is the third most populous city in Turkey, with a population of 3.7 million in 2007.



REGISTRY STRUCTURE AND METHODS

The ICR was the first population-based cancer registry in Turkey. It was founded in 1992 as a special project and is now a department of the Izmir Provincial Health Directorate. An advisory committee oversees the registry's activities and makes strategic decisions. All incident cancer cases (diagnosed by any method) are registered, including both invasive and in situ lesions at any anatomical site (including non-melanoma skin cancers) and benign tumours of the brain. For each case, the ICR collects a set of mandatory information items, which has been defined based on SEER registry rules. The registry uses IARC/IACR and European Network of Cancer Registries (ENCR) rules for multiple primary tumours. The ICR collects data from all health care facilities in the province, including university, provincial, municipal, and private hospitals; 23 private cancer centres; 25 private pathology laboratories; and several physicians' offices. Nine hospitals have hospital-based registries, from which the ICR receives data directly. These registries are supervised by the ICR and apply the same rules for collecting, abstracting, and coding data. For all other sources, data collection is active, carried out by three full-time medically qualified registry staff members who visit and collect cancer data from 15 hospitals and 12 clinics and laboratories. Routine quality control procedures, including internal checks and preparation and examination of cross-tables, are carried out regularly. Case finding and re-abstracting audits, IARC DEPedits software, and cross-tabulations are also used periodically to identify erroneous data.

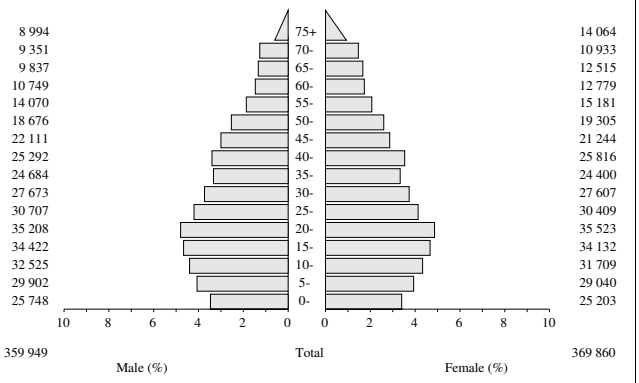
Turkey, Trabzon

REGISTRATION AREA
The Trabzon Cancer Registry covers Trabzon Province in north-eastern Turkey. The province has an area of 4685 km^2 and in 2005 had a population of 721 000 (58.9% living in urban areas). The provincial capital (the city of Trabzon) is a port city on the Black Sea coast.

CANCER CARE FACILITIES
Cancer cases are diagnosed in six provincial centres, eight district hospitals, two private hospitals, and three private pathology centres.



REGISTRY STRUCTURE AND METHODS
The registry has recorded incident cancer cases in Trabzon Province and neighbouring provinces since 1995. It is staffed by four full-time health workers, and an additional 14 staff members are based in hospitals. Two staff members visit the university hospital. The registry uses active registration; it collects data from all hospitals and some clinics that provide cancer diagnostic and treatment services in the province. The registry uses ICD-O-3 for topography and histology coding and CanReg software for database management and data processing.

INTERPRETING THE RESULTS
The number of undiagnosed cancer cases is unknown, but the proportion is probably higher among elderly residents in rural areas.

USE OF THE DATA
The registry publishes an annual report on cancer incidence, highlighting trends and changes.

Turkey, Trabzon (2005-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION
Based on data collected by the primary health centres (for 2003–2006) and on data from the Turkish Statistical Institute's address-based population registration system (for 2007).

NOTES ON THE DATA
*No official mortality data.

Austria

REGISTRATION AREA

The Austrian National Cancer Registry covers the entire population of Austria. About 90% of the country's residents are Austrian citizens. Residents of other nationalities are mostly Germans, Czechs, Serbs, and Turks. Approximately 74% of the population is Roman Catholic. Austria is made up of nine federal states; 20.3% of the country's population lives in the state of Vienna, 19.2% in Lower Austria, 16.8% in Upper Austria, 14.4% in Styria, 8.4% in Tyrol, 6.7% in Carinthia, 6.3% in Salzburg, 4.4% in Vorarlberg, and 3.4% in Burgenland.

CANCER CARE FACILITIES

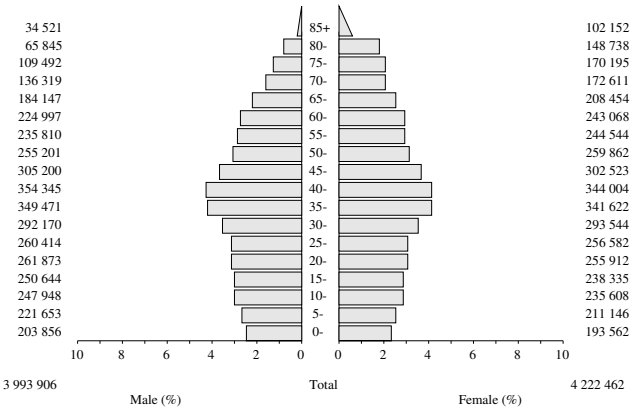
Approximately 99% of Austrian residents are covered by health insurance. Inpatient treatment is provided by 273 hospitals, and three quarters of all Austrian hospital beds are maintained by the country's 129 public hospitals. About 70 hospitals have oncology departments, many of which provide radiotherapy.

REGISTRY STRUCTURE AND METHODS

In accordance with the 2000 Federal Statistics Act, the Austrian government appointed Statistics Austria as the national provider of various statistics, including cancer statistics. The collection of all statistics prescribed by this law is financed by the government. The 1969 Cancer Statistics Act and the 1978 Cancer Statistics Ordinance provide the legal basis for the registry and require hospitals to report every cancer. There are 13 people (10.5 full-time equivalents) directly involved in the registry's workflow: a project manager, a project assistant, 10 registrars, and an information technology specialist. All incoming data are stored in an electronic database, and data checks at the national level are performed using the IARC-CHECK program. The registry uses the IARC/IACR rules for multiple primary tumours. Data from pathology laboratories and various study groups are used for quality control and completeness assessments.

INTERPRETING THE RESULTS

Opportunistic screening for cervical, breast, and prostate cancers is carried out throughout Austria. Some regions also provide organized screening for prostate and colon cancers. However, the registry only includes cancer cases reported by hospitals.



USE OF THE DATA

The registry publishes annual reports on incidence, prevalence, survival, and mortality; data are available for all years since 1983. The registry provides data and ad hoc analyses to external institutions for research purposes.

Austria, Tyrol

REGISTRATION AREA

The Cancer Registry of Tyrol covers the population of Tyrol – one of the nine federal states of Austria, located in the alpine region of the western part of the country. The state has an area of 12 648 km^2, of which only about 12.5% is habitable. The average altitude of the habitable regions is 740 m. About 15% of Tyrol residents are immigrants, mainly from Montenegro, Serbia, and Turkey.

CANCER CARE FACILITIES

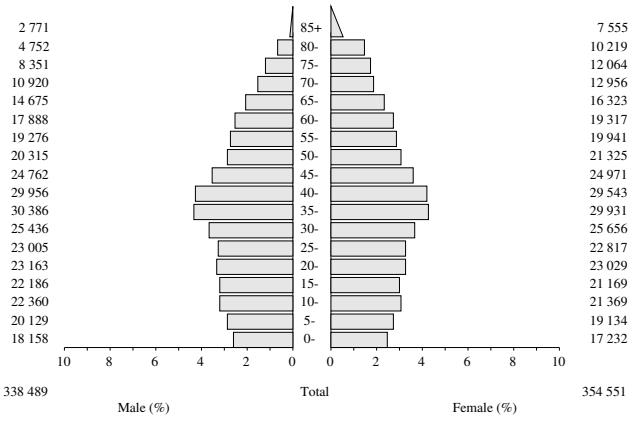
Medical facilities are provided by the Innsbruck University Hospital, two semiprivate hospitals in Innsbruck, and nine local hospitals in the rural districts. Most pathology diagnoses are made by two main hospital departments and five smaller pathology laboratories.

REGISTRY STRUCTURE AND METHODS

Since 1969, Austrian hospitals have been required by law to report every cancer case. The Cancer Registry of Tyrol began operation at the end of 1986 and has been population-based since 1988. The registry is staffed by a part-time epidemiologist, a full-time registrar, two part-time registrars, and several data entry clerks. Follow-up information is based on probabilistic record linkage between incidence data and all-cause mortality data for the state of Tyrol. Data are checked using the IARC-CHECK program and routines developed by the registry.

INTERPRETING THE RESULTS

The population of Tyrol is relatively stable, although the proportion of immigrants is increasing. An organized mammography screening programme covering all of Tyrol was rolled out in 2008. Prostate-specific antigen (PSA) testing was introduced in 1988–1989 and has been available free of charge since 1993 to all men aged 45–74 years. The Pap test, the haemoccult test, and colonoscopy are offered free of charge within the framework of opportunistic screening programmes. Dermatologists organize early detection activities for melanoma every spring.



USE OF THE DATA

The registry has published annual reports every year since 1988. Registry data are widely used by physicians (especially at Innsbruck Medical University), and department quality assessment programmes make use of published survival rates. Survival data have also been analysed by the EUROCARE study group. A comprehensive analysis of data quality was published in 2009.

Austria, Vorarlberg

REGISTRATION AREA

The Vorarlberg Cancer Registry covers the population of Vorarlberg, the westernmost of the nine federal states of Austria. At the 2007 census, the population was 365 000 (185 000 females and 180 000 males), living in 96 communities, including five cities. The population is mostly Caucasian, and 78% of residents are Roman Catholic. Further information is available from http://www.vorarlberg.at/.

CANCER CARE FACILITIES

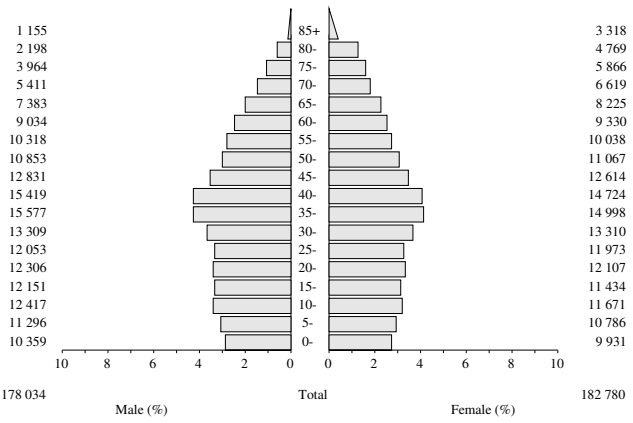
Five public and two private hospitals offer cancer treatment. In special cases, patients are sent to the Innsbruck University Hospital in the state of Tyrol. Vorarlberg has one radio-oncology department and one palliative care department.

REGISTRY STRUCTURE AND METHODS

A law requiring Austrian hospitals to report every case of cancer to the Austrian Federal Bureau of Statistics was passed in 1968. The Vorarlberg Cancer Registry was founded in 1978 within the pathology department of Feldkirch State Hospital, and electronic data processing started in 1981. Local registries forward their data to Statistics Austria. The Vorarlberg Cancer Registry is part of the Austrian Working Group for Preventive and Social Medicine (AKS), working on behalf of the local government in the field of health promotion, preventive medicine, and social medicine. The registry's data sources are pathology laboratories, cancer reporting sheets, hospital information systems, radio-oncology departments, death certificate notifications, and death-certificate-only registrations. The registry is staffed by part-time medical doctors, a trained registrar, and an information technology manager. An initial quality assessment is performed by one of the doctors before data are entered. The IARC-CHECK program, plausibility checks established by the registry, and a record linkage system are also used.

INTERPRETING THE RESULTS

The population of Vorarlberg is stable, and there have been no changes in the structure of medical services or the availability of diagnosis and treatment. The registry used ICD-O-1 coding in 2003 and updated to ICD-O-3 coding for 2004–2007.



USE OF THE DATA

Registry data have been used to evaluate local cancer screening initiatives, such as programmes for early detection of breast, cervical, and colon cancers. The registry also participated in the publication *Cancer Mapping in Alpine Regions 2001–2005*. For further information see http://www.aks.or.at/.

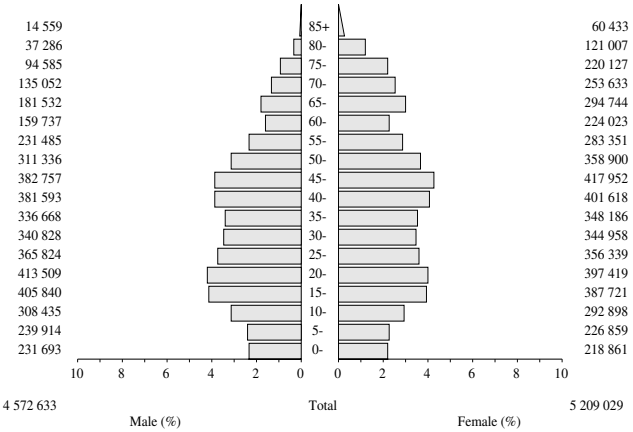
Belarus

REGISTRATION AREA
The Belarusian Cancer Registry covers the entire population of Belarus.



CANCER CARE FACILITIES
Doctors in all health care facilities are required to send full details of every new cancer case to one of the country's 12 oncology dispensaries, which in turn submit data to the central registry. In each region, a regional oncologist is responsible for registering incidence, diagnosis, and treatment details.

REGISTRY STRUCTURE AND METHODS
Registration of malignant neoplasms has been mandatory in Belarus since 1953. All cases must be registered either during the patient's lifetime or after death. In 1973, a computerized central cancer registry was established within the Republican Institute of Oncology and Medical Radiology. To increase the comprehensiveness of the data, the inclusion of prophylactic observations and active follow-up was later introduced. Deaths are registered through monthly checking of data from dispensaries and clinics against the data from the state offices responsible for registering deaths. A registration card identifies each patient by his or her ID number, given name and family name, place of residence, etc. Multiple primary tumours are registered individually so that the corresponding data can be analysed together. Hospitals where malignant tumours are diagnosed provide registration information, as do pathology laboratories (when cancer is diagnosed at autopsy). Computer checks for consistency are performed at the time of data entry. Duplication is prevented by using an alphabetical index of patients' names together with visual control where necessary. In recent years, oncology dispensaries have been provided with monthly updates of current statistical data. Special registration of cases of late diagnosis is also carried out.

USE OF THE DATA
Registry data are used for planning cancer control activities and performing onco-epidemiological research. Special cancer control studies have been organized in regions polluted with radionuclides after the Chernobyl Nuclear Power Plant accident.

Belgium

REGISTRATION AREA

The Belgian Cancer Registry covers the Kingdom of Belgium. In 2010, the population was 10.8 million (17% aged more than 65 years). The life expectancy at birth was 77.2 years for males and 82.4 years for females.

CANCER CARE FACILITIES

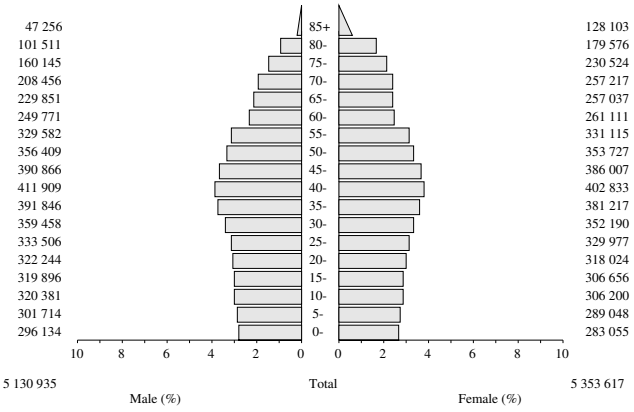
Medical care is easily accessible, and cancer care is provided by general and academic hospitals. In 2010, there were 3.6 physicians per 1000 residents. Medical insurance is mandatory, and more than 99% of the population is covered.

REGISTRY STRUCTURE AND METHODS

Belgium's seven health insurance companies have been collecting data on new cancer diagnoses since 1983. Due to the incompleteness of these data, various local registries were started in the Flemish Region (in the northern part of Belgium). These local initiatives were integrated into the Flemish Cancer Registry Network in 1998, and data for the Flemish Region were included in *Cancer Incidence in Five Continents, Volume VIII*. The Belgian Cancer Registry was founded in 2005, and Belgium has implemented oncology and cancer registration laws resulting in complete national coverage since 2004. The registry uses both passive and active data collection. All data are submitted electronically. The registry uses the national registration number as a unique patient identifier, which enables accurate records linkage and follow-up of vital status.

INTERPRETING THE RESULTS

There were no regional or national organized screening programmes for cervical or breast cancer until 2001, but many women regularly received Pap testing and mammography. In June 2001, a national breast cancer screening programme was launched among women aged 50–69 years. There are also local screening initiatives for cervical cancer and malignant melanoma. Opportunistic prostate-specific antigen (PSA) testing is becoming increasingly common.



USE OF THE DATA

Annual incidence data tabulated by sex, age, primary site, and geographical location are available from the registry's website (http://www.belgiancancerregistry.be/). More detailed analyses of incidence and survival are regularly reported in various publications. The registry is also involved in evaluating screening programmes and quality-of-care projects, and supports the initial setup of quality-of-care projects.

Belgium (2004-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on annual estimates provided by the Belgian National Register.

NOTES ON THE DATA

*No DCO registrations. High MV%. †C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Bulgaria

REGISTRATION AREA

The Bulgarian National Cancer Registry (BNCR) covers the population of Bulgaria. The country is divided into 28 districts, whose populations differ in terms of size, age structure, urban and rural proportions, and ethnic and religious compositions. About 70% of the population lives in urban areas. Approximately 83% of residents are Bulgarian, and 17% are Turkish, Romani, Armenian, Jewish, Greek, or of other ethnicities. Eastern Orthodox Christianity is the most common religion.

CANCER CARE FACILITIES

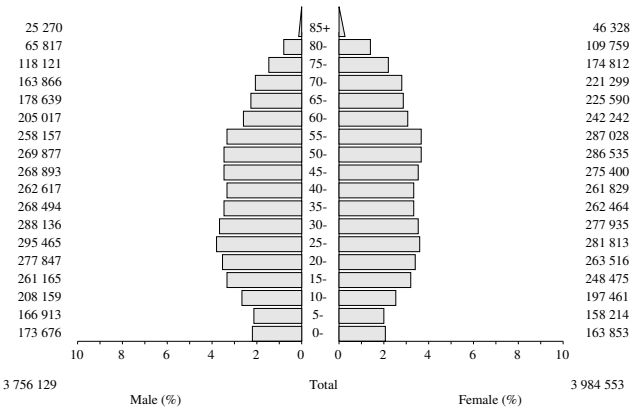
Cancer care is provided by the National Hospital of Oncology (NHO), regional oncology centres (ROCs), university hospitals, and some municipal hospitals where facilities for complex treatment are available. A state-run, socially oriented, mandatory health insurance system was introduced in 2000. The Minister of Health defines a guaranteed medical services package and supervises its provision.

REGISTRY STRUCTURE AND METHODS

The Bulgarian Ministry of Health mandated the registration of malignant neoplasms through national instructions issued in 1964 and national orders issued in 1990 and 2011. Cancer registration is funded by the ministry. There have been no changes in coverage. The BNCR and 13 regional cancer registries (RCRs) were established in 1952. The BNCR is part of the NHO, and each RCR is part of an ROC. The registries are certified by the Bulgarian Commission for Personal Data Protection, which was established by a parliamentary decision in 2002. The BNCR staff consists of a physician, a statistician, a database specialist, and five registrars. The staff of each RCR includes a physician and two or three registrars who collect information from all data sources in their region using active and passive methods. Quality control procedures are regularly performed at the BNCR, and the registry uses international classifications and standards. The ICD-10 coding system was adopted by the BNCR in 2005.

INTERPRETING THE RESULTS

Opportunistic screening for breast and cervical cancers has been available in Bulgaria since 2000 and is covered by the National Health Insurance Fund.



USE OF THE DATA

The BNCR publishes annual reports on cancer incidence, prevalence, and regional distributions, as well as patient age and disease stage. The data are accessed by researchers, policy-makers, patients, etc., and are used for epidemiological studies, reports, communications, and planning and evaluation of health services.

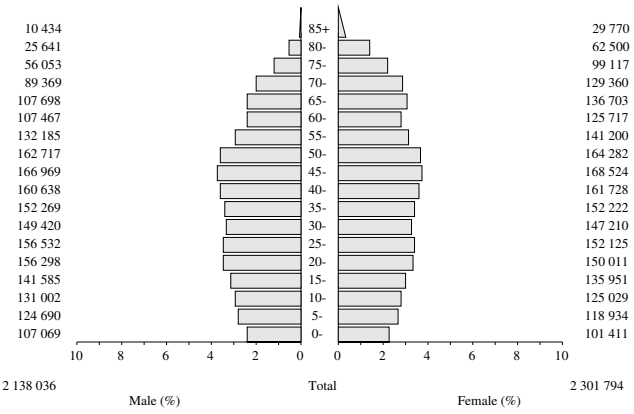
Croatia

REGISTRATION AREA
The Croatian National Cancer Registry covers the entire population of the Republic of Croatia. Administratively, Croatia is divided into 20 counties and the capital city of Zagreb.

CANCER CARE FACILITIES
In 2007, the health service entry points were 2552 primary care physicians (general practitioners, gynaecologists, and paediatricians). There were 23 general hospitals, 14 clinical teaching hospitals, and several specialized hospitals, including one dedicated to oncology. Most hospitals in Croatia treat cancer patients, but the main regional oncology centres (offering a full range of services) are located in the clinical hospitals in Zagreb, Split, Osijek, and Rijeka.



REGISTRY STRUCTURE AND METHODS
The registry is part of the Epidemiology of Chronic Diseases Service at the Croatian National Institute of Public Health (CNIPH) in Zagreb, and is funded by the Croatian Ministry of Health and Social Welfare and the Croatian Health Insurance Fund. The registry's primary data sources are notifications from hospitals and primary care providers, pathology reports, and mortality databases. Notifications include the name of the health care provider (hospital or physician) that the registry can contact for further information. Electronic hospital discharge records are a supplementary data source. Topography is coded using ICD-10, and morphology is coded using ICD-O-2.

INTERPRETING THE RESULTS
An organized population-based screening programme for breast cancer was introduced at the end of 2006, and for colorectal cancer in 2007. Opportunistic screening for cervical cancer has been provided since the 1960s, and the number of Pap tests administered yearly is increasing. Opportunistic screening with the faecal occult blood test is carried out in some regions, and prostate-specific antigen (PSA) testing is becoming more common (although only in patients with urological symptoms).

USE OF THE DATA
Cancer incidence data have been presented in an annual report (a bulletin published in Croatian and English) and in the CNIPH's joint annual report since 1976. Analyses are published in medical journals and postgraduate theses and presented at health congresses and other scientific meetings. Registry data on cancer incidence and mortality are also used for planning and evaluation of preventive measures and various health care services.

Cyprus

REGISTRATION AREA

The Cyprus Cancer Registry (CyCR) is a population-based registry that covers the residents of the government-controlled area of Cyprus, as well as non-residents who are treated for cancer at facilities operating within the area. The government-controlled area is divided into five districts. In 2005, the population of the area was 766 000.

CANCER CARE FACILITIES

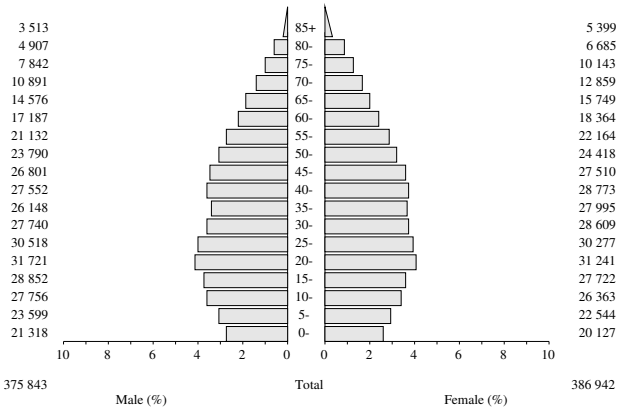
General health care in Cyprus is provided by the Ministry of Health (through district hospitals – the primary health care centres) and through the private sector. The Bank of Cyprus Oncology Centre, a non-profit organization funded by the government, provides cancer patients with health care services including radiotherapy and chemotherapy.

REGISTRY STRUCTURE AND METHODS

The CyCR is funded by the Ministry of Health and the Middle East Cancer Consortium (MECC). Its main offices are located within the Ministry of Health. The registry is part of the ministry's Health Monitoring Unit and functions under the direction of the unit's coordinator. The Permanent Secretary of the Ministry of Health has administrative responsibility for the CyCR. The registry is staffed by three tumour registrars, all of whom have received training in the principles of cancer registration through courses organized by the MECC.

INTERPRETING THE RESULTS

The completeness and accuracy of the CyCR data have been evaluated by external experts from the MECC; the data quality was found to be very good, with a low rate of incomplete data. The registry is estimated to cover 92% of all cancer cases. The Ministry of Health introduced a national breast cancer screening programme in 2003 for women aged 50–69 years and a colorectal cancer screening programme in February 2013 for men and women aged 50–69 years.



USE OF THE DATA

CyCR data are used mainly for reporting incidence rates and conducting research. Registry data are increasingly being requested and used by many professionals for presentations, reports, and other scientific work, and often appear in the media. Cancer cluster investigations have been conducted using registry data in response to requests from about 20 local communities. The CyCR also prepares triennial reports, progress reports, and statistical reports for publication on the Ministry of Health's website.

§Includes 74 cases of unknown age

Czech Republic

REGISTRATION AREA

The Czech National Cancer Registry (CNCR) covers the population of the entire Czech Republic. The population is relatively ethnically homogeneous, with only a small proportion of immigrants. The majority of the population is non-religious. There have been no significant changes in the registry's coverage.

CANCER CARE FACILITIES

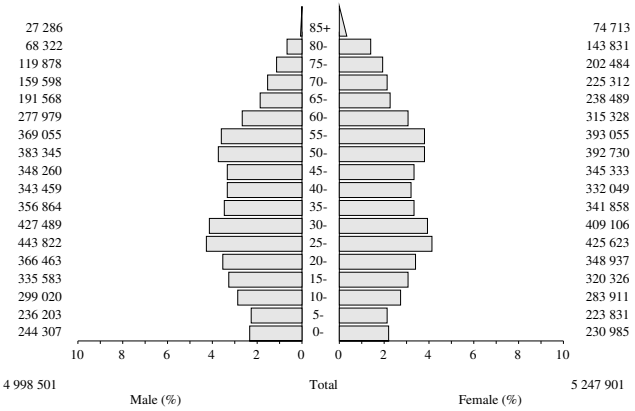
The CNCR was instituted in 1977 and is now a key database component of the Czech National Cancer Control Programme (started in 2003), which centralizes cancer care in a regionally distributed network of 21 comprehensive cancer care centres, ensuring the availability and coordination of cancer care for all patients. The Czech Republic has a system of mandatory health insurance, which fully covers cancer diagnosis and treatment.

REGISTRY STRUCTURE AND METHODS

The registration of all newly diagnosed malignant tumours is mandated by national legislation. The CNCR also stores personal identification information for the purposes of data validation and linkage. The registry is part of the National Health Information System (NHIS) and is administered by the Institute of Health Information and Statistics (IHIS) of the Czech Republic. The transfer of personal and other data to the NHIS is regulated by the Czech Act on Personal Data Protection. Regional CNCR centres compile and validate reports from health care providers. The IHIS then performs data checks and linkages with the national mortality database. Within the IHIS, the CNCR Council serves as an advisory board and expert panel, ensuring the high quality of the registry's data. The members of the council include representatives of the IHIS, regional CNCR centres, the Ministry of Health, and the Czech Society for Oncology.

INTERPRETING THE RESULTS

The increasing incidence and prevalence of malignant neoplasms in the Czech Republic is associated with many factors, especially with the ageing of the population and developments in cancer care. A breast cancer screening programme was started in 2002; this has both increased the incidence of breast cancer diagnosis and resulted in earlier detection of the disease.



USE OF THE DATA

The IHIS publishes a standard annual report on cancer incidence in the Czech Republic, which is available from http://www.uzis.cz/. CNCR data are also used for research projects by the Czech Society for Oncology, and in some international projects. Aggregated outputs from the CNCR are available to the public through the System for Visualization of Oncology Data (SVOD) web portal at http://www.svod.cz/.

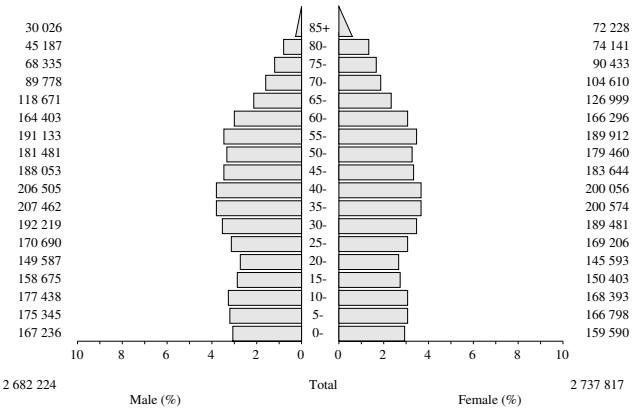
Denmark

REGISTRATION AREA
The Danish Cancer Registry covers the Kingdom of Denmark (excluding Greenland and the Faroe Islands), an area of 43 080 km^2. In 2005, the population was 5.4 million.

CANCER CARE FACILITIES
Free health care is provided to all residents. Cancer surgery is performed at general hospitals and oncology centres, and 23 pathology laboratories service the hospital departments. Non-surgical cancer treatment is partially centralized at five university hospitals with radiotherapy and oncology expertise. National cancer control plans were formulated in 2000, 2005, and 2008. The 2005 plan included integrated pathways for cancer diagnosis, which were implemented in 2008–2009.



REGISTRY STRUCTURE AND METHODS
The registry began systematic data collection in 1943, and registration has been mandated by administrative order since 1987. The registry was run by the Danish Cancer Society until 1997, when it was transferred to the National Board of Health. In 2004, paper notification was replaced by electronic notification through the Danish National Patient Register, and linked with the Danish Pathology Register and the Danish Register of Causes of Death (Gjerstorff, 2011). The registry is staffed by employees filling two full-time equivalent positions. Data validity is ensured by daily manual quality control routines, automated data checks, and the use of multiple notifications from different data sources. Before the use of electronic notification, the data were 95–97% complete (Storm et al., 1997) and are now considered to be more complete. Additional information is obtained from other registries through linkage. The registry adopted ICD-O-3 coding in 2004, and registrations from 1978–2003 have also been converted to ICD-O-3. Registration of TNM stage is mandatory.

INTERPRETING THE RESULTS
Organized mammography screening was initiated in two regions (covering 20% of the population) in 1991 and nationwide in 2007. Prostate-specific antigen (PSA) testing is not promoted in asymptomatic men.

USE OF THE DATA
Registry data are used extensively for research and can be accessed and tabulated from the NORDCAN database (http://www.ancr.nu/), which includes annual data since 1943.

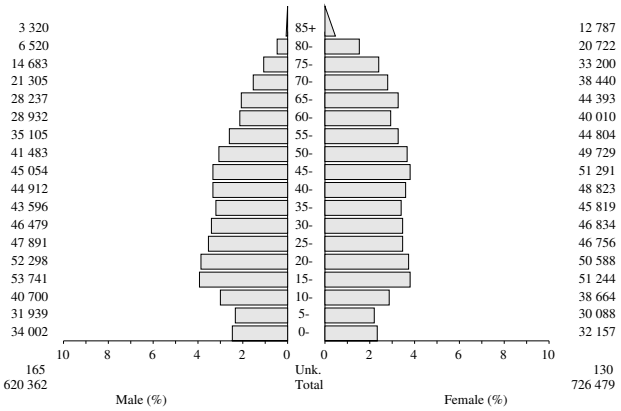
Estonia

REGISTRATION AREA
The Estonian Cancer Registry covers the population of Estonia. In 2005, the mean annual population was 1.3 million; 68% were Estonians and 26% were Russians, and 67% of residents lived in urban areas.

CANCER CARE FACILITIES
The Estonian health system is based on a mandatory, solidarity-based insurance system that covers 95% of the population. Cancer patients are mostly referred to two specialized hospitals, which provide radiotherapy, surgery, and chemotherapy. Increasingly, some aspects of cancer care are provided by general hospitals and other specialized departments (such as neurosurgery, haematology, and paediatric oncology departments). A National Cancer Control Plan was implemented in 2007.



REGISTRY STRUCTURE AND METHODS
The registry was founded in 1978, and reliable incidence data are available beginning from 1968. The registry is state-funded, through the Ministry of Social Affairs, and has operated as a subunit of the National Institute for Health Development since 2009. The registry is staffed by four employees: a director, a data analyst, and two coding clerks. Cancer reporting is mandated in Estonia by a decree issued by the Minister of Social Affairs. In 2011, the new Public Health Act came into force and cancer reporting became mandatory by law. The registry receives notifications from treating physicians and pathology and haematology laboratories, and the registry staff members code and input the data. The registry receives death certificate data and performs trace-back procedures for cases first notified by a death certificate. From 2001 to 2011, access to death certificates was denied for legal reasons, but the registry regained access in 2011 when the new legal basis for health registries was adopted. Since 2000, the registry has performed regular linkage with the Estonian Population Register. The quality of the registry's data has not been formally evaluated, but a study that partially covered the subject was published in 2003.

INTERPRETING THE RESULTS
Nationwide organized screening was implemented for breast cancer in 2003 and for cervical cancer in 2006. Prostate-specific antigen (PSA) testing is widely used.

USE OF THE DATA
The registry routinely publishes cancer incidence statistics. Registry data have been used for several descriptive and analytical epidemiological studies, including international comparisons.

Finland

REGISTRATION AREA

The Finnish Cancer Registry covers all of Finland, which is bordered to the north by Norway, to the east by the Russian Federation, to the west by Sweden and the Gulf of Bothnia, and to the south by the Gulf of Finland. The average altitude is 150 m. Finland is located within the coniferous forest zone and has 33 615 km^2 of inland water. In 2005, the population of Finland was 5.2 million. The life expectancy at birth is 76.7 years for males and 83.2 years for females.

CANCER CARE FACILITIES

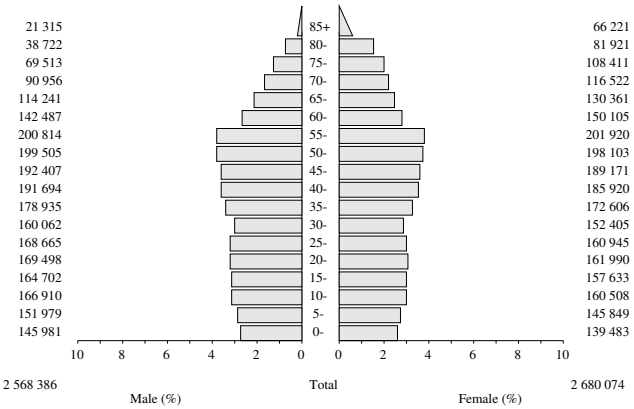
Finland is divided into 22 health care districts, five of which have university teaching hospitals. Cancer diagnosis and treatment is only partly centralized; cancer surgery is provided in all major hospitals and many smaller clinics. Eleven hospitals have a radiotherapy unit.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1952 as an initiative of the Cancer Society of Finland. Data on newly diagnosed cancer cases have been collected since 1953. The principal sources of information on cancer cases are physicians, hospitals, pathology laboratories, and death certificates from Statistics Finland. Cancer reporting has been mandatory since 1961. When necessary, the registry sends requests to notifiers to ensure the accuracy of information about patient identity, primary site, and date of diagnosis. Coding is performed or supervised by a physician. Case identification is based on the personal identification number used in Finland since 1967. This also enables accurate follow-up of cancer patients for death through official sources. In addition to continuous quality control procedures, formal evaluations are also carried out.

INTERPRETING THE RESULTS

Nationwide screening programmes for breast, cervical, and colorectal cancers are coordinated, monitored, and evaluated by the Mass Screening Registry, which is part of the Finnish Cancer Registry. Opportunistic prostate-specific antigen (PSA) testing is very common.



USE OF THE DATA

The registry produces routine statistics and data for planning and health education purposes. It is also actively engaged in research on cancer epidemiology, biometrics, and cancer patient survival. The registry provides material for clinical research and pathology studies, and follow-up data on cancer patients.

France, Bas-Rhin

REGISTRATION AREA

The Bas-Rhin Cancer Registry covers the population of the department of Bas-Rhin, which is located in the northern half of the Alsace region of France, on the west side of the Rhine River (which serves as a natural border with Germany). The department has a total area of 4758 km^2 and a maximum altitude of 1100 m (in the foothills of the Vosges Mountains). The population density of Bas-Rhin is 217 residents/km^2, and 44% of residents live in the urban district of Strasbourg, the regional capital. In 2005, the life expectancy in Bas-Rhin was 77 years for males and 83 years for females. Approximately 66% of the economically active population works in the service sector, 25% in industry (mainly the mechanical and electrical construction industries and the food industry), and 2% in agriculture. Bas-Rhin is a relatively wealthy department; incomes are high, as is consumer spending – notably on food.

CANCER CARE FACILITIES

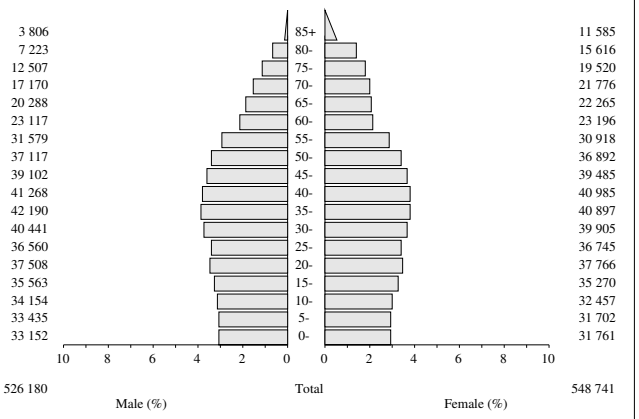
Bas-Rhin residents have a high level of access to medical care, with 440 hospital beds per 100 000 residents. There are 1900 general practitioners and 2200 specialists registered in the department. The Alsace regional comprehensive cancer centre is located in Strasbourg, as is the regional university hospital.

REGISTRY STRUCTURE AND METHODS

Cancer registration is active; doctors from the registry regularly visit the many data sources to distribute an epidemiological questionnaire and establish lists of new cases. These lists are then compared with hospital discharge data, pathology records, and medical insurance data to ensure complete registration and eliminate errors (particularly duplicate registrations). Cancers discovered on autopsy are also registered.

INTERPRETING THE RESULTS

An organized screening programme for breast cancer was introduced in 1989 (initially among women aged 50–65 years, and later extended to include women aged up to 75 years). An organized screening programme for cervical cancer was started in 1994 (among women aged 25–65 years).



USE OF THE DATA

The data are regularly analysed and published on the registry's website and are used by the local health agency for planning purposes. They are also used for national estimates of cancer incidence, prevalence, and survival in France, within the framework of a collaboration between the Institute for Public Health Surveillance, the National Cancer Institute, and the French network of cancer registries (FRANCIM).

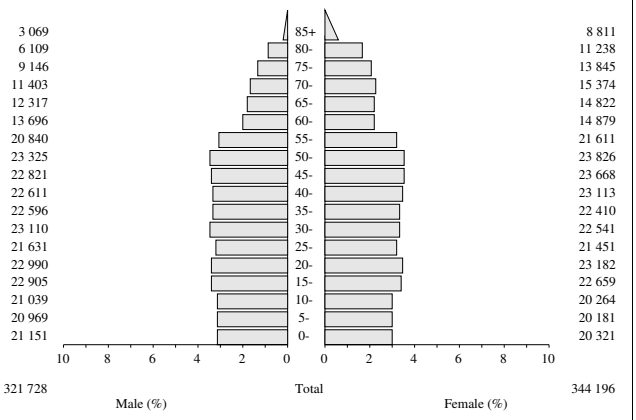
France, Calvados

REGISTRATION AREA
The department of Calvados is in the Lower Normandy region of north-western France. Its area of 5548 km^2 is divided into 579 rural and 127 urban communes. The population is 678 000.

CANCER CARE FACILITIES
Calvados has a university hospital, a regional comprehensive cancer centre, 12 public or private general hospitals (two with radiotherapy facilities), and five pathology laboratories.

REGISTRY STRUCTURE AND METHODS
Calvados is covered by three cancer registries: the Calvados General Cancer Registry, the Calvados Digestive Cancer Registry, and the Lower Normandy Hemopathy Registry. All are supported by the National Cancer Institute, the Institute for Public Health Surveillance (part of the Ministry of Health), and Caen University. They are part of the French network of cancer registries (FRANCIM). Registration has been continuous since 1978, and the databases are declared to the National Commission on Information Technology and Civil Liberties. Registration is active; information is taken directly from medical and pathology records in Calvados and neighbouring areas. The registries link the data from all sources to ensure completeness and prevent duplicate registration. TNM stage and treatment are routinely coded by the digestive cancer registry. Follow-up information is collected regularly.

INTERPRETING THE RESULTS
An organized screening programme for breast cancer began in 1996, and for colorectal cancer in 2004.



USE OF THE DATA
Registry data are used to analyse incidence and trends; to evaluate screening programmes and treatments; and to study socioeconomic and geographical determinants of incidence, survival, and quality of life.

France, Doubs

REGISTRATION AREA

The Doubs Cancer Registry covers the population of the department of Doubs, which is located in the Franche-Comté region of eastern France and has a total area of 5234 km^2. In 2007, the population was 520 000, with 348 000 residents living in urban areas and 172 000 in rural areas.

CANCER CARE FACILITIES

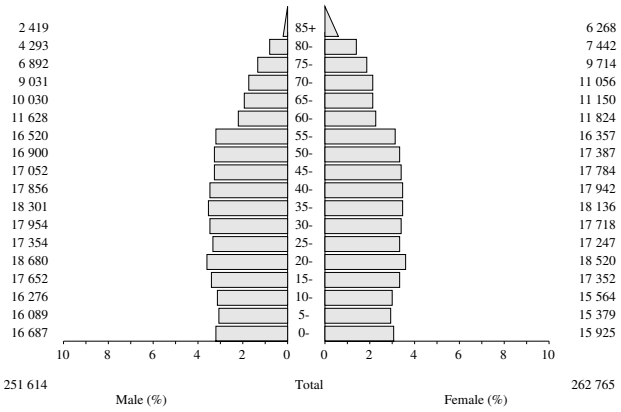
The number of specialists and general practitioners per 100 000 residents is slightly higher in Doubs (352) than the national average (341). The department has five public hospitals (including one university hospital) and four private health care facilities, but no specialized cancer centres. There are two radiotherapy units: one in the university hospital of Besançon and one in the general hospital in the north of the department.

REGISTRY STRUCTURE AND METHODS

The registry began in 1976. It is a general population-based registry, based in the university hospital of Franche-Comté. Registration activities are funded mainly by the Institute for Public Health Surveillance (part of the Ministry of Health) and the university hospital of Besançon. The registry is staffed by nine people (eight full-time equivalents), who carry out registration and research activities. The main data sources are the regional pathology and cytology laboratories, medical information systems in public and private care facilities, and health insurance notifications. Cancer registration is active; registry staff members visit the data sources and collect information from electronic medical records. The registry follows the confidentiality rules of the National Commission on Information Technology and Civil Liberties.

INTERPRETING THE RESULTS

Organized screening for cervical cancer was introduced in 1993 for women aged 25–65 years, but the programme was discontinued in 2005. Organized screening for breast cancer (among women aged 50–74 years) started in 2003.



USE OF THE DATA

The registry publishes basic descriptive statistics, conducts studies with local clinicians and epidemiologists, and collaborates with other registries in the French network of cancer registries (FRANCIM) and the EUROCARE network. Registry data are used in estimates of the incidence and prevalence of cancer in France, and in survival and evaluation-of-care studies of diagnostic and therapeutic regimes for cancer at selected sites.

France, Haut-Rhin

REGISTRATION AREA

The Haut-Rhin Cancer Registry covers the department of Haut-Rhin in the Alsace region of north-eastern France. It has an area of 3522 km^2 and a population density of 211 residents/km^2. The department is divided into 377 communes, 34 of which are rural (accounting for 7% of the population) and 23 of which have more than 5000 residents (accounting for 57% of the population). Compared with France as a whole, Haut-Rhin has a higher proportion of economically active residents aged 15–64 years (73%) and a lower proportion of residents aged more than 65 years. Approximately 69% of the economically active population works in the service sector, 22% in industry, 7% in construction, and 2% in agriculture. A specific characteristic related to the geographical location of Haut-Rhin is that 12% of the employed population works across the border in Switzerland or Germany. The unemployment rate is 10.1%.

CANCER CARE FACILITIES

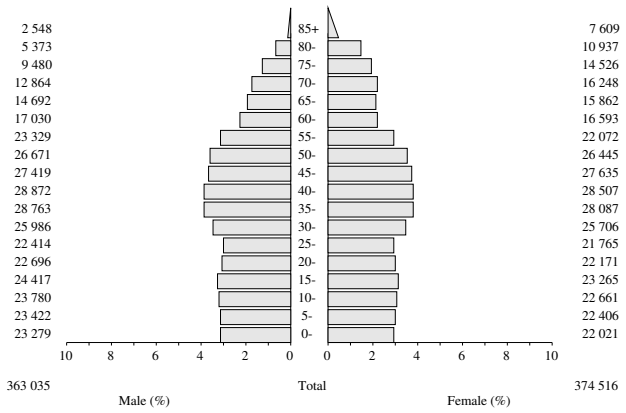
The numbers of general practitioners and specialists per 100 000 residents are lower in Haut-Rhin (96 and 61, respectively) than the national averages (111 and 87, respectively). The department's hospital infrastructure (public and private) includes 1705 beds in medical wards, 1099 beds in surgical wards, and 319 beds in gynaecology and obstetrics wards. There are two radiotherapy departments but no specialized cancer centre.

REGISTRY STRUCTURE AND METHODS

The registry was created in 1988. It is a general population-based registry administered by a non-profit organization. Data are systematically checked and completed using secondary sources; the average number of sources per case is more than three. Data are stored using IARC CanReg4 software.

INTERPRETING THE RESULTS

Organized screening for cervical cancer (among women aged 25–65 years) has been available since 2001, for breast cancer (among women aged 50–64 years) since 2002, and for colorectal cancer (among men and women aged 50–74 years) since 2003.



USE OF THE DATA

The registry was created to collect medical data and quantify the cancer burden in Haut-Rhin. It also contributes to cancer prevention, screening, and treatment by maintaining a continuously updated database for the Public Health Authority.

France, Hérault

REGISTRATION AREA

The Hérault Cancer Registry covers the population of the department of Hérault, which is located in the Languedoc-Roussillon region of southern France, on the Mediterranean Sea. The department has a total area of 6101 km^2. In 2006, the population of Hérault was 1 million (48% male and 52% female), and the population density was 164 residents/km^2. The department is highly urbanized; the urban population is 4.25 times as large as the rural population.

CANCER CARE FACILITIES

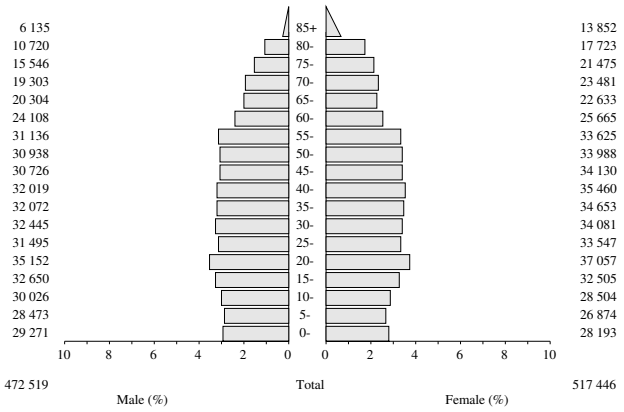
Hérault residents have a high level of access to medicosocial facilities; the department has a specialized cancer hospital, 10 public hospitals (including one academic hospital in Montpellier), and 16 private clinics. The numbers of general practitioners and specialists per 100 000 residents are higher in Hérault (200 and 246, respectively) than the national averages.

REGISTRY STRUCTURE AND METHODS

The registry is located in Montpellier, the department's capital. Most of the registry's funding comes from the French Ministry of Health (through the Institute for Public Health Surveillance and the National Cancer Institute). The registry has seven employees: a medical epidemiologist, a biostatistician, a secretary, a registrar, and three investigators. Registration is active; medical and pathology records are consulted by the registry's investigators. Death certificates are not used as a source. All invasive cancers and some in situ cancers are registered, with the exception of basal cell carcinomas of the skin. Active follow-up is performed on all registered cases.

INTERPRETING THE RESULTS

Two organized breast cancer screening programmes (for women aged 40–49 years and 50–74 years) were started in 1999. Hérault is the only area in France that is covered by a cancer registry and has an organized breast cancer screening programme for women aged 40–49 years. An organized screening programme for colon cancer was started in 2004.



USE OF THE DATA

Registry data are published biannually. The registry conducts many studies (such as case–control studies, health economics studies, and evaluations of therapeutic practices), both independently and in collaboration with other French and European registries.

France, Isère

REGISTRATION AREA

The Isère Cancer Registry covers the population of the department of Isère, which is located in the Rhône-Alpes region of south-eastern France and includes part of the French Alps. The department has a total area of 7431 km^2 and is highly urbanized. In 2009, the population of Isère was 1.2 million (49% male and 51% female), with a population density of 162 residents/km^2.

CANCER CARE FACILITIES

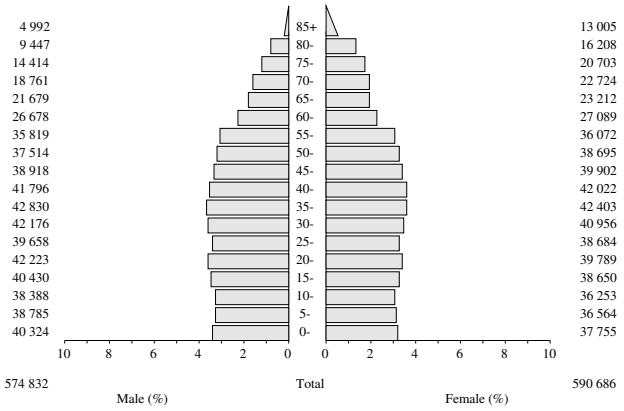
Isère and neighbouring departments (such as Rhône, where a significant proportion of the Isère population is treated) have a high level of specialized medical equipment, distributed across one specialized cancer hospital, two academic hospitals (in Grenoble and Lyon), and many public hospitals and private clinics. The level of medical coverage in Isère is high, with 167 general practitioners and 159 specialists per 100 000 residents.

REGISTRY STRUCTURE AND METHODS

The registry is located in Grenoble, the department's capital. Most of the registry's funding comes from the French Ministry of Health (through the Institute for Public Health Surveillance and the National Cancer Institute) and the local government of Isère. The registry has 10 employees: an epidemiologist/biostatistician, a medical epidemiologist, a half-time physician, a data manager, four registrars, and two part-time secretaries. Registration is both passive/semi-active (through the use of medico-administrative and pathology records) and active (through the consultation of medical records by registry investigators). Death certificates are not used as a source. All invasive and in situ cancers are registered, with the exception of basal cell carcinomas of the skin. Active follow-up is performed on all registered cases.

INTERPRETING THE RESULTS

Isère has an organized screening programme for breast, colorectal, and cervical cancers (among women aged 50–74 years), which was started in 1990. An organized screening programme for colorectal cancer in men was started in 2002.



USE OF THE DATA

Registry data are included in the French network of cancer registries (FRANCIM) database and are used to estimate national incidence and survival. The data are also used in a variety of descriptive epidemiological studies (e.g. for prevalence estimations or for the description of the diagnosis circumstances of certain cancer sites.)

France, Loire-Atlantique

REGISTRATION AREA

The Loire-Atlantique Cancer Registry covers the population of the department of Loire-Atlantique, which is located in the Pays de la Loire region of western France. At the 1999 census, the population was 1.1 million. About 54% of Loire-Atlantique residents live in urban areas.

CANCER CARE FACILITIES

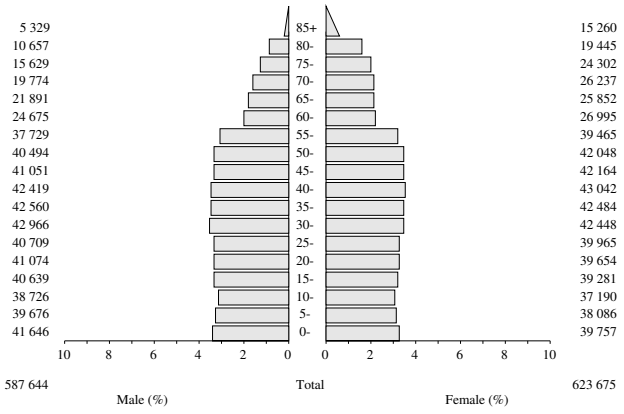
There are 16 public and 43 private hospitals in Loire-Atlantique, including one university hospital and one cancer centre. The department has 2001 general practitioners and 2209 specialists.

REGISTRY STRUCTURE AND METHODS

The Loire-Atlantique Cancer Registry is part of the general population-based Loire-Atlantique and Vendée Cancer Registry, which was created in 1998 and is one of the largest registries in France. The Loire-Atlantique and Vendée Cancer Registry is affiliated with the French network of cancer registries (FRANCIM) and is administered by a non-profit association according to the French Associations Bill of 1901. It is funded by the Institute for Public Health Surveillance, the National Cancer Institute, and local organizations. The registry is staffed by two medical epidemiologists, a part-time histopathologist, and other employees filling 12.4 full-time equivalent positions. Data are actively collected from the medical records of several data sources (primarily pathologists, medical information systems in hospitals and clinics, and health insurance notifications). The use of death certificates as a data source for cancer registration is prohibited by French law. Although cancer is not a reportable disease, some registration forms are received from private practitioners. The quality of the registry data is verified every 4 years by the National Committee of Registries, and the registry's confidentiality practices are monitored by the National Commission on Information Technology and Civil Liberties.

INTERPRETING THE RESULTS

Loire-Atlantique has an organized breast cancer screening programme for women aged 50–74 years, which was started in 1996.



USE OF THE DATA

The registry publishes basic descriptive data in its annual reports and participates in national collaborative studies. It has also participated in several special studies, such as evaluations of clinical care for breast cancer and colon cancer and survival.

France, Manche

REGISTRATION AREA

The Manche Cancer Registry is a general population-based registry that covers the population of the department of Manche, which is located in the Lower Normandy region of France. The department has 330 km of coastline and a total area of 5938 km^2. At the 2007 census, the population was 495 000. The population is slightly older than the national average and is mainly rural, with only 48% of residents living in Manche's five urban areas.

CANCER CARE FACILITIES

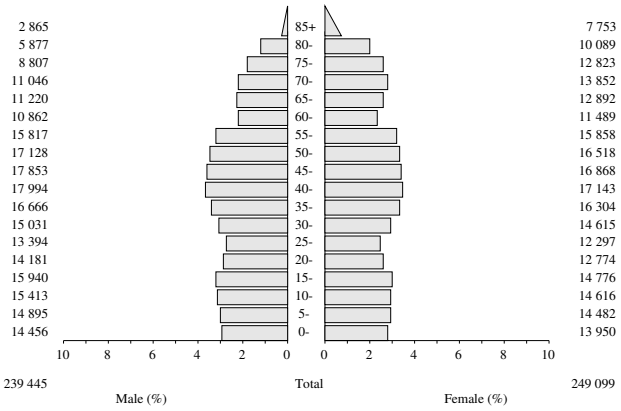
The level of medical coverage in Manche is relatively low. There are 11 public hospitals (general and local) and seven private care facilities. There are no specialized cancer centres in the department, but there are two radiotherapy units: a private unit in the south and a public unit in the north, which is a delocalized facility associated with the regional cancer care centre in the neighbouring department of Calvados.

REGISTRY STRUCTURE AND METHODS

The registry began its activities in 1994. It is based in the general hospital in Cherbourg and was created by an association of practitioners in the department. The registry is supported by the Institute for Public Health Surveillance, the General Council of Manche, the local chapter of the French League Against Cancer, the department's communes, and other local organizations. It is affiliated with the French network of cancer registries (FRANCIM). The registry is staffed by a medical epidemiologist and other employees filling 4.5 full-time equivalent positions. Data are actively collected from regional sources, including pathology and cytology laboratories, oncology and radiotherapy services, and hospitals' medical records departments. After initial notifications, every file is checked in regional (private and public) medical facilities and then coded to ICD-O. All invasive and in situ cancers are registered except basal cell carcinomas of the skin. Death certificates are not used as a source of data.

INTERPRETING THE RESULTS

Manche has an organized breast cancer screening programme for women aged 50–74 years, which was started in 2004.



USE OF THE DATA

The registry publishes basic descriptive data and participates in collaborative studies at the national and international level.

France, Somme

REGISTRATION AREA

The Somme Cancer Registry covers the department of Somme in the Picardy region of France. The western half of Somme is both rural and industrial, with a large industrial area around the city of Amiens. Cereal and industrial crops are grown in the east. In 2013, the population was 571 000, with 133 000 residents in Amiens and fewer than 30 000 residents in each of the other towns.

CANCER CARE FACILITIES

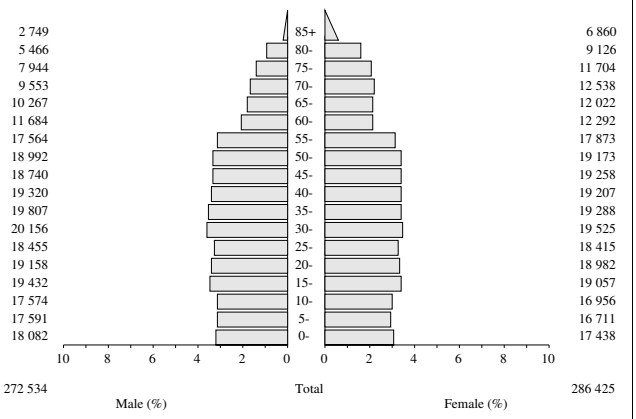
Cancer treatment is provided in six towns in Somme, in regional university hospitals, general hospitals, and clinics. There are no cancer centres, but chemotherapy and radiotherapy are offered at two institutions. In 90% of cases, residents are treated entirely within the registration area. Multidisciplinary consultation meetings have become essential for the organization of care.

REGISTRY STRUCTURE AND METHODS

The registry is subject to the French Associations Bill of 1901. It is funded by the Institute for Public Health Surveillance, the National Cancer Institute, the departmental committee of the French League Against Cancer, and the Regional Council of Picardy. It is part of the French network of cancer registries (FRANCIM). The registry employs an epidemiologist, a technical director, four cancer registrars, and a data manager. Cancer is not a reportable disease. Data are actively collected from medical and administrative records, and 94 additional sources are solicited for notifications. The registrars consult medical and administrative files to validate and update incident cases. All identifying information is confidential, and the registry's operation is monitored by the National Commission on Information Technology and Civil Liberties. Regular data checks ensure quality and consistency, and data quality is verified every 4 years by the National Committee of Registries.

INTERPRETING THE RESULTS

The registry began using new sources in the 2000s, which improved data completeness. Screening programmes for breast and colorectal cancers began in 1990 and 2007, respectively. Prostate-specific antigen (PSA) testing was introduced in 1996.



USE OF THE DATA

The registry publishes descriptive epidemiology analyses and performs studies both independently and in collaboration with other registries. The registry is a member of the regional oncology network, and its data are used for planning and developing care and screening programmes.

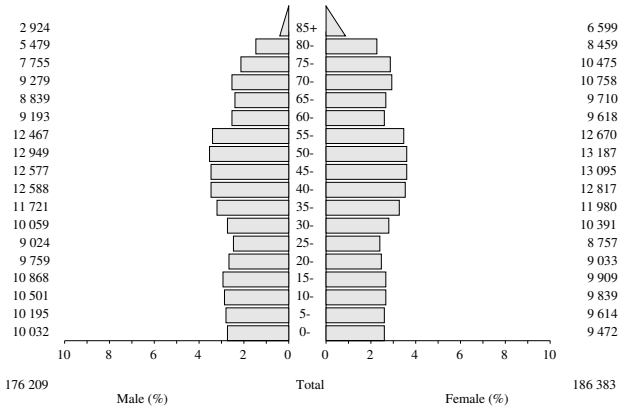
*See note following population pyramid

France, Tarn

REGISTRATION AREA
The Tarn Cancer Registry covers the department of Tarn in the Midi-Pyrénées region of southern France. The population is 362 000.

CANCER CARE FACILITIES
The level of medical coverage in Tarn is relatively high. The department has five pathologists, two oncologists, two radiotherapists, four public hospitals, and four private clinics. Some cancer patients are referred to the university hospital or the regional cancer control centre, both located in Toulouse, the regional capital.



REGISTRY STRUCTURE AND METHODS
The registry operates as a non-profit association. It is funded by the General Council of Tarn, the departmental committee of the French League Against Cancer, and the Institute for Public Health Surveillance. The registry staff consists of 11 people (7.5 full-time equivalents), who are responsible for both registration and research activities. Notifications are systematically checked and completed by consulting medical files. The data are coded by specially trained coders. The registry's database is declared to the National Commission on Information Technology and Civil Liberties.

INTERPRETING THE RESULTS
The apparent doubling of the observed incidence of bladder cancer in Tarn since the previous volume of *Cancer Incidence in Five Continents* is due to the inclusion of non-invasive bladder tumours in the data for this volume. The incidence rates of invasive tumours are relatively stable, at about 15 cases per 100 000 males and 2 cases per 100 000 females. The incidence of kidney cancer is increasing in France overall, and more rapidly in Tarn. This trend is assumed to be due to increased urological monitoring in men of this age, and to increased diagnosis after incidental discovery in women. The registry is involved in the European Randomized Study of Screening for Prostate Cancer; the first screening campaign in Tarn, in 2004, at least partly explains the observed increase in the incidence of prostate cancer in the area.

USE OF THE DATA
The registry performs a variety of studies, both independently and in collaboration with other registries. The topics investigated include cancer incidence, time trends, and prevalence, as well as diagnostic and therapeutic practices for cancers at selected sites.

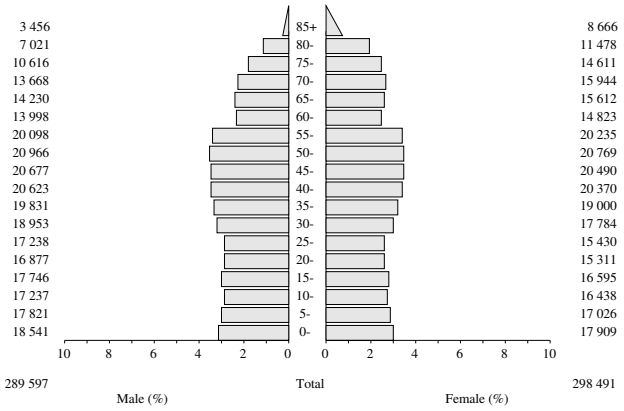
France, Vendée

REGISTRATION AREA
The Vendée Cancer Registry covers the population of the department of Vendée, which is located in the Pays de la Loire region of western France. At the 1999 census, the population was 540 000. About 25% of Vendée residents live in urban areas.

CANCER CARE FACILITIES
There are 12 public and 19 private hospitals in Vendée. The department has 821 general practitioners and 556 specialists.



REGISTRY STRUCTURE AND METHODS
The Vendée Cancer Registry is part of the general population-based Loire-Atlantique and Vendée Cancer Registry, which was created in 1998 and is one of the largest registries in France. The Loire-Atlantique and Vendée Cancer Registry is affiliated with the French network of cancer registries (FRANCIM) and is administered by a non-profit association according to the French Associations Bill of 1901. It is funded by the Institute for Public Health Surveillance, the National Cancer Institute, and local organizations. The registry is staffed by two medical epidemiologists, a part-time histopathologist, and other employees filling 12.4 full-time equivalent positions. Data are actively collected from the medical records of several data sources (primarily pathologists, medical information systems in hospitals and clinics, and health insurance notifications). The use of death certificates as a data source for cancer registration is prohibited by French law. Although cancer is not a reportable disease, some registration forms are received from private practitioners. The quality of the registry data is verified every 4 years by the National Committee of Registries, and the registry's confidentiality practices are monitored by the National Commission on Information Technology and Civil Liberties.

INTERPRETING THE RESULTS
Vendée has an organized breast cancer screening programme for women aged 50–74 years, which was started in 2002.

USE OF THE DATA
The registry publishes basic descriptive data in its annual reports and participates in national collaborative studies. It has also participated in several special studies, such as evaluations of clinical care for breast cancer and colon cancer and survival.

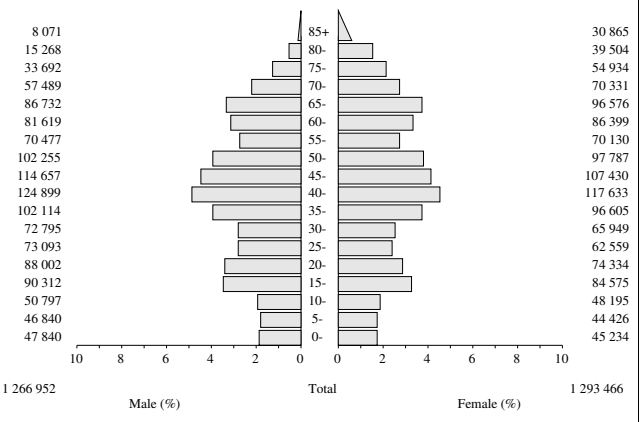
Germany, Brandenburg

REGISTRATION AREA
The federal state of Brandenburg, located in north-eastern Germany, is one of six states covered by the Common Cancer Registry (CCR). Most of the state's population is Caucasian.

CANCER CARE FACILITIES
There are 47 hospitals in Brandenburg, most of which are affiliated with one of five regional tumour centres. Some of the hospitals specialize in oncology services, and most of the other hospitals also provide some cancer care. The regional tumour centres serve as focal points for cancer care; they are specific university hospitals and other hospitals that specialize in the diagnosis, treatment, and aftercare of cancer patients and in the documentation of related information.



REGISTRY STRUCTURE AND METHODS
Cancer notification became mandatory in Brandenburg in 2006, and patients should be informed about registry notification by their diagnosing physician. The major sources of notification in Brandenburg are the regional tumour centres, which each abstract all relevant information from the medical records of Brandenburg cancer patients seen in the affiliated hospitals and clinics and report them to the CCR. The tumour centres provide about 99% of all notifications, and the other 1% are received directly from physicians. Death certificates are provided to the registry by local health authorities.

INTERPRETING THE RESULTS
There are opportunistic screening programmes in Brandenburg for colon, prostate, cervical, and breast cancers. There are no known unusual environmental or occupational exposures in the area.

USE OF THE DATA
Brandenburg cancer data have been used for health services planning and epidemiological research. Linkage with the CCR has been performed for case–control and cohort studies. Reports on cancer incidence and mortality are published periodically.

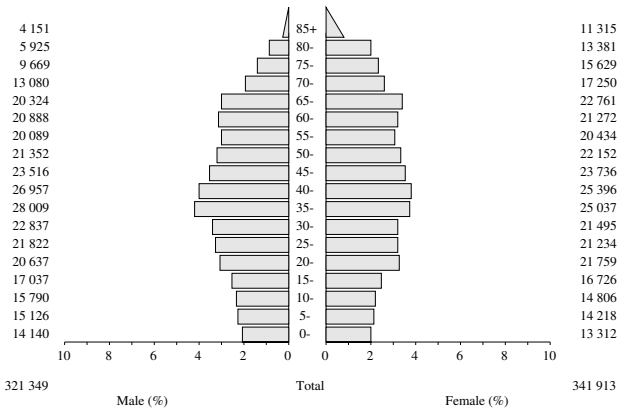
Germany, Bremen

REGISTRATION AREA
The Bremen Cancer Registry covers the Free Hanseatic City of Bremen (also called the State of Bremen), the smallest federal state in Germany. The state consists of two cities in northern Germany: Bremen and Bremerhaven, which account for 82% and 18% of the state's population, respectively. The cities are separated from each other and surrounded by the federal state of Lower Saxony. Almost all residents live in urban areas.

CANCER CARE FACILITIES
In 2005, there were 14 hospitals in the State of Bremen (10 in the city of Bremen and 4 in Bremerhaven), most of which offered cancer diagnosis and treatment, including four certified oncology centres for breast cancer and three radiotherapy facilities. Additional cancer centres are planned. As in all German states, health insurance is mandatory for the majority of the population.



REGISTRY STRUCTURE AND METHODS
The registry was established in 1998 within the legal framework of the Bremen Cancer Registry Law. To protect data confidentiality, the registry is separated into two parts: a notification office, which receives notifications and generates a pseudonym for each case, and a registration office, which performs data analyses. The registry is funded by the government. Notification of new cancer cases has been mandatory for pathologists since 2001.

INTERPRETING THE RESULTS
The registry's build-up phase was completed in 2001; since then, the data have been estimated to be more than 95% complete, according to an annual review of incidence-to-mortality ratios and cancer incidence rates in established German cancer registries. An organized mammography screening programme was started in the city of Bremen in 2001. Opportunistic screening has been available for colorectal cancer (by colonoscopy) since 2002 and for skin cancer since 2008.

USE OF THE DATA
The registry publishes an annual report including incidence, extent of disease, and survival data. The most recent data are available through an online database (http://www.krebsregister.bremen.de/). Registry data are regularly used for third-party and registry research projects. The data are annually transmitted to a central federal institution (the Robert Koch Institute) and to the association of German cancer registries for national health reporting purposes. Periodic feedback is provided to notifying physicians.

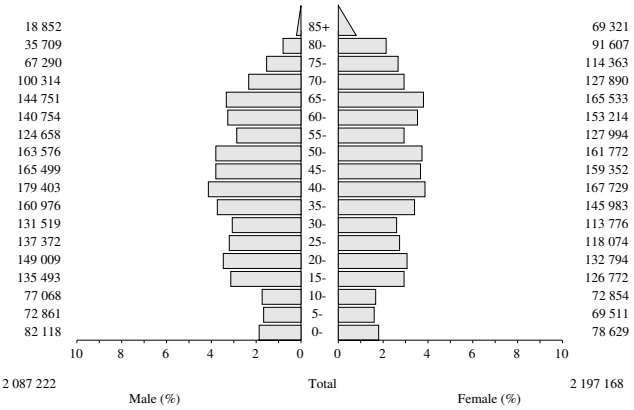
† See note following population pyramid

Germany, Free State of Saxony

REGISTRATION AREA
The Free State of Saxony, a federal state located in east-central Germany, is one of six states covered by the Common Cancer Registry (CCR). Most of the state's population is Caucasian.

CANCER CARE FACILITIES
There are 80 hospitals in Saxony, most of which are affiliated with one of six regional tumour centres. Some of the hospitals specialize in oncology services, and most of the other hospitals also provide some cancer care. The regional tumour centres serve as focal points for cancer care; they are specific university hospitals and other hospitals that specialize in the diagnosis, treatment, and aftercare of cancer patients and in the documentation of related information.



REGISTRY STRUCTURE AND METHODS
Cancer notification became mandatory in Saxony in 1993, and patients should be informed about registry notification by their diagnosing physician. The major sources of notification in Saxony are the regional tumour centres, which each abstract all relevant information from the medical records of Saxony cancer patients seen in the affiliated hospitals and clinics and report them to the CCR. The tumour centres provide about 99% of all notifications, and the other 1% are received directly from physicians. Death certificates are provided to the registry by local health authorities.

INTERPRETING THE RESULTS
There are opportunistic screening programmes in Saxony for colon, prostate, cervical, and breast cancers, as well as systematic screening for breast cancer. There may be elevated environmental and occupational exposure to certain types of dust in the area due to uranium mining in Saxony and Thuringia from the 1940s to 1990.

USE OF THE DATA
Saxony cancer data have been used for health services planning and epidemiological research. Linkage with the CCR has been performed for case–control and cohort studies. Reports on cancer incidence and mortality are published periodically.

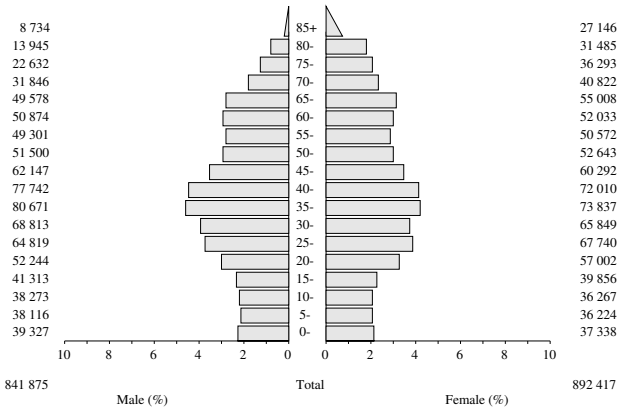
Germany, Hamburg

REGISTRATION AREA
The Hamburg Cancer Registry (HCR) covers the Free and Hanseatic City of Hamburg, one of the 16 federal states of Germany. With 1.7 million residents in its predominantly urban area of 755 km^2, Hamburg is the country's second most populous city.

CANCER CARE FACILITIES
Medical care is provided through a complex health care system involving about 3200 registered doctors and 51 hospitals, including a university hospital. Specialized cancer care is available to all residents, mainly at 10 hospital departments and 10 oncology practices, supplemented by numerous diagnostic, therapeutic, and supporting facilities. Nearly the entire population is covered by statutory or private health insurance.



REGISTRY STRUCTURE AND METHODS
The HCR, established in the late 1920s, is run by the state health authority and staffed by four scientists, two computer experts, and six documentation and coding employees. Since 1985, the registry's operation has been based on a law stipulating physicians' right to report cancer cases on the condition of informed consent and data confidentiality. Since 2007, the registry's plain-text records have been supplemented by pseudonymous pathology reports. Cases are transmitted electronically (since 2004) or using paper record sheets. Data processing includes routine automated checks for plausibility and duplicate reports.

INTERPRETING THE RESULTS
The number of reports to the HCR (even from earlier years) is rising constantly, due to electronic data transmission and retroactive submissions. Although the registry's overall completeness has been determined by the independent Robert Koch Institute to be sufficient, the HCR's data quality varies considerably depending on the site and year of diagnosis. Early detection methods such as the Pap test, prostate-specific antigen (PSA) testing, and mammography are widely used in Hamburg, but their precise prevalence and influence on incidence rates are difficult to determine.

USE OF THE DATA
Reports on cancer epidemiology in Hamburg are published regularly, and aggregate data are available from http://www.krebsregister.hamburg.de/ and http://www.gekid.de/. Major oncology institutions in Hamburg receive annual feedback about reporting activity and survival trends. Registry data are also provided for research.

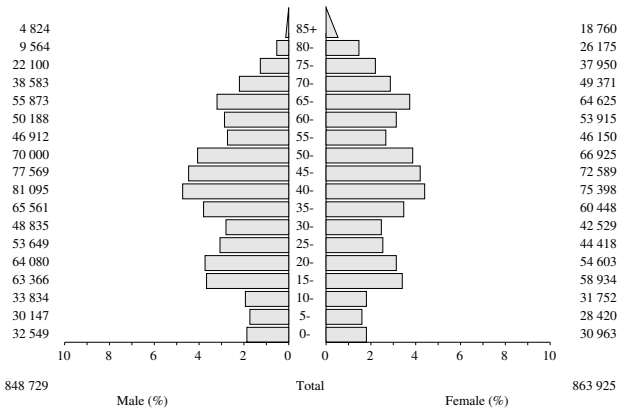
† See note following population pyramid

Germany, Mecklenburg-Western Pomerania

REGISTRATION AREA
The federal state of Mecklenburg-Western Pomerania, located in north-eastern Germany, is one of six states covered by the Common Cancer Registry (CCR). Most of the state's population is Caucasian.

CANCER CARE FACILITIES
There are 33 hospitals in Mecklenburg-Western Pomerania, most of which are affiliated with one of four regional tumour centres. Some of the hospitals specialize in oncology services, and most of the other hospitals also provide some cancer care. The regional tumour centres serve as focal points for cancer care; they are specific university hospitals and other hospitals that specialize in the diagnosis, treatment, and aftercare of cancer patients and in the documentation of related information.



REGISTRY STRUCTURE AND METHODS
Cancer notification became mandatory in Mecklenburg-Western Pomerania in 1998, and patients should be informed about registry notification by their diagnosing physician. The major sources of notification in Mecklenburg-Western Pomerania are the regional tumour centres, which each abstract all relevant information from the medical records of Mecklenburg-Western Pomerania cancer patients seen in the affiliated hospitals and clinics and report them to the CCR. The tumour centres provide about 97% of all notifications, and the other 3% are received directly from physicians. Death certificates are provided to the registry by local health authorities.

INTERPRETING THE RESULTS
There are opportunistic screening programmes in Mecklenburg-Western Pomerania for colon, prostate, cervical, and breast cancers, as well as systematic screening for breast cancer. There are no known unusual environmental or occupational exposures in the area.

USE OF THE DATA
Mecklenburg-Western Pomerania cancer data have been used for health services planning and epidemiological research. Linkage with the CCR has been performed for case–control and cohort studies. Reports on cancer incidence and mortality are published periodically.

REGISTRATION AREA

The Munich Cancer Registry (MCR) is one of six regional registries on which the Bavarian cancer registration system (covering 12 million people) is based. During 2003–2007, the population covered by the MCR was about 3.8 million, but the number had already risen to 4.5 million at the time of writing.

CANCER CARE FACILITIES

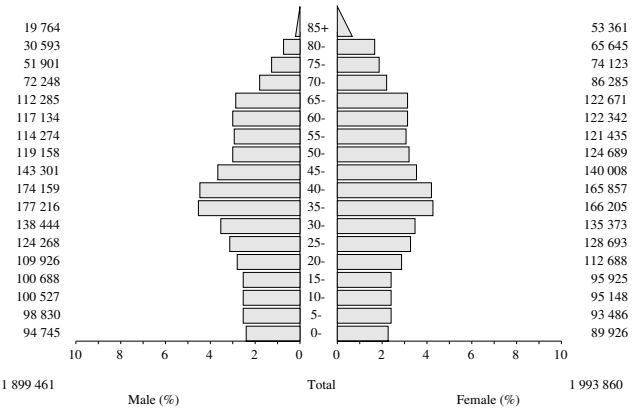
Health care in the region is provided by hospitals and private practitioners. There are two university hospitals in the city of Munich. Most hospitals cooperate with the Munich Cancer Centre (MCC). The MCR supports networking in oncology by compiling cancer data from all sources. Individual and aggregate data are provided to cooperating doctors.

REGISTRY STRUCTURE AND METHODS

The MCR is associated with the MCC. The area's 20 pathology laboratories report incidence data and prognostic data such as TNM stage, histology, and grade. In parallel, clinicians from about 70 hospitals submit information about patient residency, tumour diagnosis, International Federation of Gynecology and Obstetrics (FIGO) stage, primary surgical and systemic therapy, palliative care, and follow-up. Collaborating institutions and hospitals also report cases of metastasis and local or regional relapse. Radiotherapy reports are also available. Vital status is systematically followed up using death certificates.

INTERPRETING THE RESULTS

An organized population-based screening programme for breast cancer among women aged 50–69 years was started in Bavaria at the end of 2003, and a national mammography screening programme was established throughout Germany at the end of 2006.



USE OF THE DATA

The MCR contributes to outcome research conducted by clinicians and epidemiologists. Registry data are used for evaluation of therapeutic strategies and for quality control measures to improve population-based, guideline-oriented health care delivery. The most common cancer diagnoses are analysed in detail, and periodic reports are provided online (via password access) to all participating hospitals. Key outcome criteria are anonymously compared between hospitals for the purposes of benchmarking. Some registry data are available online to the scientific community (via open access) from http://www.tumorregister-muenchen.de/.

REGISTRATION AREA

The North Rhine-Westphalia Epidemiological Cancer Registry was established in 2005 as a statewide register for the federal state of North Rhine-Westphalia (NRW), which is located in north-western Germany, bordering the Netherlands and Belgium. The registry data reported in this volume are restricted to a single district of the state, the *Regierungsbezirk* (administrative district) of Münster, where a population-based register has been maintained since 1985. In 2007, the population of Münster was 2.6 million (48.8% male and 51.2% female) and the population density was 378 residents/km^2. The majority of residents are Roman Catholic.

CANCER CARE FACILITIES

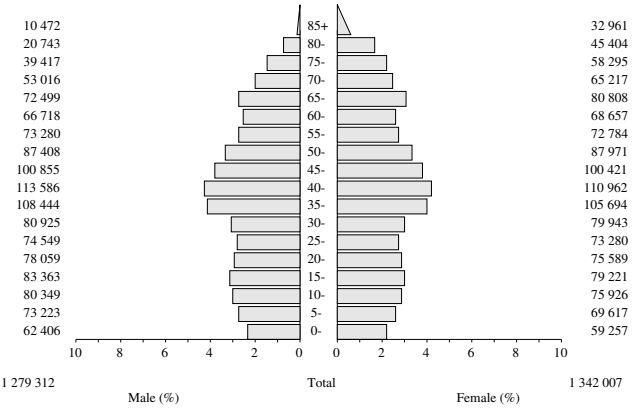
Cancer treatment is provided predominantly by hospitals. The registration area has 63 hospitals with more than 20 000 beds. Microscopic examination and diagnosis is performed by 14 pathology laboratories.

REGISTRY STRUCTURE AND METHODS

The Münster registry was established in 1985 within the framework of the NRW Law of Cancer Registration. At that time, cancer notification was voluntary and required patients' signed consent. The sources of notifications for the registry were hospitals, outpatient facilities, and private practitioners. In 1998, the registry began to receive pseudonymous reports from pathologists. The registry database was linked annually with death certificates from the district, and trace-back was performed for cases first registered by death certificate. In July 2005, new legislation came into force that expanded the registration area to the entire federal state of NRW (18 million residents). Pseudonymous notification of new cancer cases is now mandatory for all physicians, and all pathologists are required to report any histopathological findings of malignant disease.

INTERPRETING THE RESULTS

Since the registry began receiving reports from pathologists in 1998, its completeness has been estimated to be more than 90% for cancer cases at all sites except C44 (other skin).



USE OF THE DATA

The registry publishes reports on cancer incidence and mortality. Registry data can also be accessed through an interactive database on the registry's website. The registry contributes to the evaluation of the NRW mammography screening programme (part of the national programme), and registry data are increasingly used in the context of health service research.

Germany, Saarland

REGISTRATION AREA

The Saarland Cancer Registry covers the population of the federal state of Saarland, which is located in south-western Germany. In 2007, the population was 1 million (48.6% male and 51.4% female) and the life expectancy was 75.8 years for males and 81.2 years for females. The state consists of five counties and one metropolitan area.

CANCER CARE FACILITIES

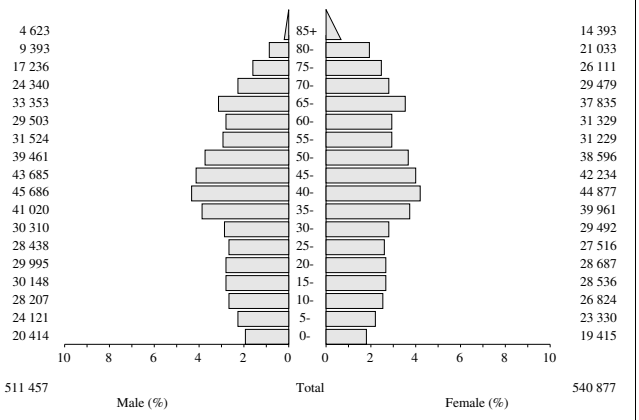
Cancer care is provided by hospitals and private physicians. The registration area has 25 hospitals (with a total of 130 departments). Recently, several specialized cancer centres for the treatment of major cancers (such as breast, prostate, bowel, and lung cancer) have been opened. Several private oncology practices provide diagnosis, treatment, and aftercare. Microscopic examination is performed in eight pathology laboratories.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1967, and cancer registration is mandated by state law. The basic registration system is a centralized collection of individual records including personal identifiers. Notification has been mandatory since 2002. The registry's sources of information are hospitals, cancer centres, outpatient facilities, pathology and radiotherapy departments, and general practitioners. Registered cases are linked annually with all death certificates, and trace-back is performed for cases first notified by death certificate.

INTERPRETING THE RESULTS

Early detection and population screening activities in Germany began in 1971. In Saarland, opportunistic screening is available for cervical, colorectal, prostate, and skin cancers, and an organized breast cancer screening programme is available among women aged 50–69 years.



USE OF THE DATA

The registry publishes reports on cancer incidence, mortality, and population-based survival, and these data are also available from the registry website (http://www.krebsregister.saarland.de/). The registry conducts descriptive and analytical epidemiological studies and collaborates in national and international projects.

CONTRIBUTORS

Bernd Holleczek
Christa Stegmaier

Germany, Saarland (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on the 1987 census and annual projections accounting for births, deaths, and migration.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Germany, Schleswig-Holstein

REGISTRATION AREA

The Schleswig-Holstein Cancer Registry covers Schleswig-Holstein, the northernmost federal state of Germany. The population is about 2.8 million and is mainly Caucasian. About 50% of residents live in rural areas.

CANCER CARE FACILITIES

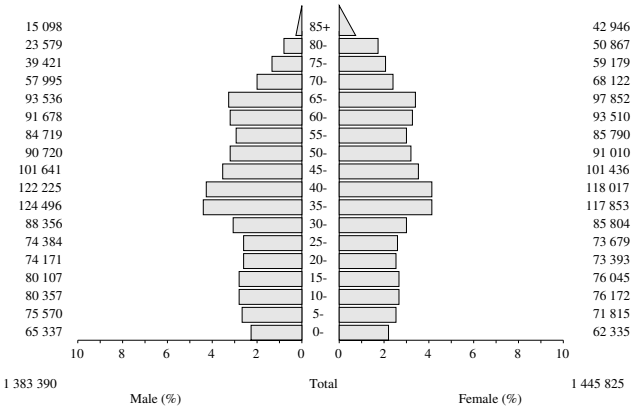
The state's health care system is part of the national health care system. Medical care is provided through a tertiary health care system (private practices and state and regional hospitals) embedded in a statutory health insurance system. About 3000 physicians, 280 hospital departments, and 15 pathologists are involved in cancer care.

REGISTRY STRUCTURE AND METHODS

Statewide cancer registration began in 1998 and is regulated by a federal law requiring mandatory notification by all physicians. Electronic access to all death certificates is provided by regional health authorities. Registration and quality control are performed according to the European Network of Cancer Registries (ENCR) and IACR guidelines. To protect data confidentiality, the registry operates in two independent units: a data collection unit located within a medical association in the town of Bad Segeberg and a registration and analysis unit at the University of Lübeck. The registry is funded by the government and staffed by a physician, two epidemiologists, two computer scientists, and 12 documentation or coding employees. Trace-back of death-certificate-only (DCO) cases has been performed since diagnosis year 2003.

INTERPRETING THE RESULTS

Data completeness is independently reviewed by the Robert Koch Institute. As expected for a new registry, the DCO rate is still high, but is declining. There were no organized screening programmes in Schleswig-Holstein until 2007, although there were pilot projects for skin and breast cancer screening. An organized breast cancer screening programme began in some parts of Schleswig-Holstein in 2007 and statewide in 2008. A systematic skin cancer screening programme began in July 2008.



USE OF THE DATA

The registry publishes annual reports of incidence, trends, stage, histology, mortality, and survival. It also maintains an interactive online database and atlas (available from http://www.cancer-sh.de/). The registry performs local analyses of suspected cancer clusters upon request, and registry data are used for a variety of scientific research. The registry facilitates contact between investigators and patients for research purposes, provided the patients gave informed consent during the registration process.

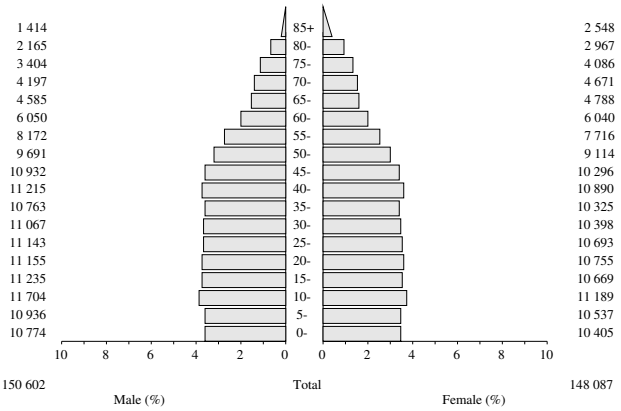
† See note following population pyramid

Iceland

REGISTRATION AREA
The Icelandic Cancer Registry (ICR) covers the Republic of Iceland, located in the North Atlantic Ocean with an area of 103 000 km^2. About 80% of the country's 320 000 residents live in the capital city of Reykjavík and the surrounding area. Most of the population is Christian (Protestant) and of northern European descent.

CANCER CARE FACILITIES
All residents have easy access to the universal health care system. Cancer surgeries are mainly performed at Iceland's two major hospitals, and specialized cancer treatment is centralized at Landspitali University Hospital in Reykjavík. Advanced imaging facilities are available at both major hospitals.



REGISTRY STRUCTURE AND METHODS
The ICR was established in 1954 by the Icelandic Cancer Society (ICS) and was legally mandated in 2007 under a new Directorate of Health Act. The ICS runs the registry under contract with the Directorate of Health, but half of the registry's funding comes from the Ministry of Welfare. Registration is mandatory, and informed consent is not required. The core registry staff consists of a medical director, a managing director, two registrars, a data manager, a computer technician, and a statistician. There are also several student and part-time researcher positions. Iceland's four pathology laboratories are the ICR's primary data sources, from which the registry receives reports of all cases of invasive tumours (C codes) and selected non-invasive tumours (D codes); 95% of cases are microscopically verified. The other data sources are haematology laboratories, hospital departments, health care facilities, private consultants, and death certificates from Statistics Iceland. Further information is requested from sources as needed. Registration is carried out according to European guidelines (Tyczynski et al., 2003), and data are checked using the IARC-CHECK program.

INTERPRETING THE RESULTS
A nationwide screening programme was implemented for cervical cancer in 1964 and for breast cancer in 1987.

USE OF THE DATA
Cancer incidence, prevalence, and survival data are published annually on the ICR website and as part of the NORDCAN project (Engholm et al., 2010), and every 4 years in a book on cancer in Iceland. The ICR conducts epidemiological research, provides data to other researchers, and provides information for the planning of cancer prevention and treatment strategies.

Ireland

REGISTRATION AREA

The National Cancer Registry covers the Republic of Ireland. In 2006, the population was 4.2 million (2.1 million males and 2.1 million females), predominantly native-born and Caucasian. Ethnicity is not recorded by the registry. Most residents (87% at the 2006 census) are Roman Catholic.

CANCER CARE FACILITIES

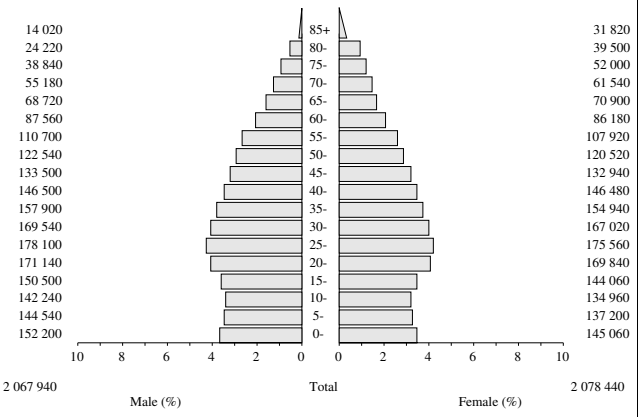
Cancer patients have access to private and public health care facilities, all of which report to the registry. About 84% of incident cases are seen in public hospitals. There are three publicly funded radiotherapy centres and six smaller private centres. Almost all cancer treatment for Irish patients is provided within the country.

REGISTRY STRUCTURE AND METHODS

Collection of population-based cancer incidence data for the entire country began in 1994. The registry is administered by the National Cancer Registry Board and fully funded by the Irish Department of Health. The registry is staffed by 42 employees, 22 of whom are engaged in active data collection. Cancer notification is not mandatory in Ireland; most information is obtained through active case finding and data abstraction. Most notifications come from pathology departments, and the rest come from other hospital sources, death certificates, and general practitioners. The registry has access to all death certificates, which are followed up with the hospital or certifying doctor if a cancer has not been registered; if such a case cannot be confirmed, it is registered as a death-certificate-only (DCO) case. The registry does not perform active follow-up. ICD-O-3 is used to code topography and morphology. All malignant, in situ, and uncertain cancers are registered, as are benign intracranial and intraspinal tumours. Completeness has been calculated at 97% at 2 years from the incidence date.

INTERPRETING THE RESULTS

Breast cancer screening began in 2000, and full population coverage was achieved by 2009. A national cervical screening programme for women aged 25–60 years began in 2009.



USE OF THE DATA

The registry publishes annual reports on incidence, mortality, treatment, and survival. It has also published several scientific papers and reports on a wide variety of topics (see http://www.ncri.ie/publications). Registry data are widely used by cancer care organizations for service planning.

† See note following population pyramid

Italy, Biella

REGISTRATION AREA

The Piedmont Cancer Registry, Province of Biella, covers the province of Biella, which has 82 municipalities and is in the Piedmont region of Italy. In 2010, the population was 186 000, with 45% living in urban areas. The textile industry plays an important role in Biella. The number of immigrants from other countries is limited (10 600 people). Biella's population is ageing; the province's elderly index (the ratio of the population aged more than 64 years to the population aged less than 15 years, multiplied by 100) is 209.6.

CANCER CARE FACILITIES

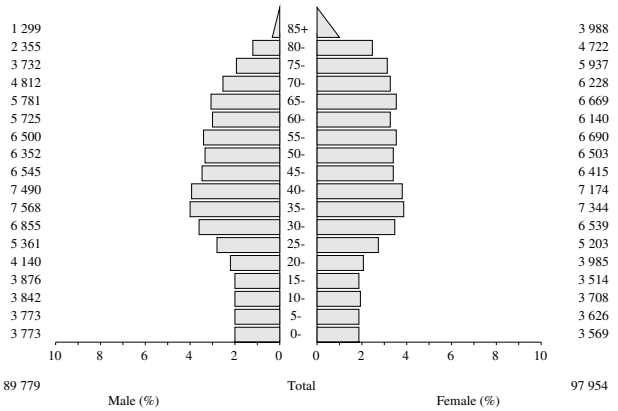
Biella's one public hospital provides all main specialities except highly specialized surgery. It has oncology, haematology, radiotherapy, and palliative care units. There are also two private clinics. Residents often travel to hospitals in nearby areas or the larger centres of Milan, Turin, Novara, and Pavia, but generally return to Biella for treatment and follow-up.

REGISTRY STRUCTURE AND METHODS

The registry is located in the epidemiology unit of the local health authority and is affiliated with the Piedmont Reference Centre for Epidemiology and Cancer Prevention (CPO Piemonte) in Turin. The registry employs one physician and one nurse, and another physician works on the mortality registry. The cancer registry is subject to general legislation on confidentiality. The registry actively obtains case reports from hospitals (160) and pathology laboratories (10) and verifies data against internal clinical databases. Hospitalization records are screened for cases, and the registry follows up for vital status and to identify patients who have emigrated out of the area.

INTERPRETING THE RESULTS

The proportion of diagnosis and treatment provided in ambulatory care facilities has increased. Population screening has been available for cervical and breast cancers since 1990 and for colorectal cancer since 2003. Opportunistic screening for prostate cancer and melanoma is provided by various cancer foundations.



USE OF THE DATA

The registry reports cancer incidence and mortality, as well as trends and changes in hospital admissions. Registry data are provided to the Italian network of cancer registries (AIRTUM) for national use and scientific research. The registry also conducts research on health services and quality.

† See note following population pyramid

Italy, Brescia

REGISTRATION AREA

The Brescia Health Unit Cancer Registry covers about 91% of the population of Brescia, one of the most densely populated provinces in the Lombardy region of northern Italy. In 2005, the province's population was 1 million, in an area of 3460 km^2 (290 residents/km^2), including the city of Brescia (about 195 000 residents) and 163 smaller towns. Foreign residents accounted for about 10% of the population (35% from eastern Europe and 30% from northern Africa).

CANCER CARE FACILITIES

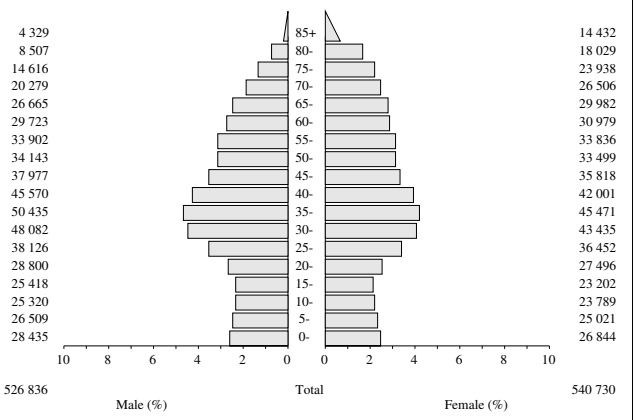
There are 12 public hospitals and nine private hospitals in the registration area. The largest hospital (in the city of Brescia) has medical and surgical specialists and a radiotherapy department.

REGISTRY STRUCTURE AND METHODS

The registry's staff members (four nurses, a secretary, a medical doctor, and a computer programmer) are employees of the Brescia Local Health Authority. The registry's scientific director is a full professor at the Institute of Hygiene, Epidemiology and Public Health of the University of Brescia. Since 2002, the Varese Province branch of the Lombardy Cancer Registry has provided the Brescia Health Unit Cancer Registry with considerable technical support. The Brescia registry uses an automated population-based cancer registration system based on three electronic sources of data: hospital discharge records, pathology reports, and death certificates. Automatic record linkage is carried out between the collected data and the social security system to assign a patient code to each record. Records are linked with prevalence data. Concordant incident malignant case reports are definitively assigned to the registry. Discordant and incomplete case reports are reviewed by registry staff members, who refer back to the original hospital clinical records as necessary. For cases reported by death certificate, the registry performs trace-back and ultimately classifies cases that cannot be linked with any other source of information as death-certificate-only (DCO) cases.

INTERPRETING THE RESULTS

Three cancer screening programmes have been active in the Brescia area since the late 1980s: a breast cancer screening programme and a cervical cancer screening programme for women and a colorectal cancer screening programme for both sexes.



USE OF THE DATA

Registry reports are available for the periods 1993–1995, 1999–2001, and 2004–2006.

Italy, Catania and Messina

REGISTRATION AREA

The Catania-Messina Section of the Integrated Cancer Registry of Catania-Messina-Siracusa-Enna covers the provinces of Catania and Messina in the autonomous region of Sicily in Italy. The Catania-Messina registry was established in 2003 and merged with the Syracuse registry in 2004, but data are still analysed separately for Catania-Messina and Syracuse. The province of Enna was annexed in 2007, leading to the coverage of about half of the Sicilian population (2.3 million people). Most residents live in medium urban (40%) or rural (40%) areas.

CANCER CARE FACILITIES

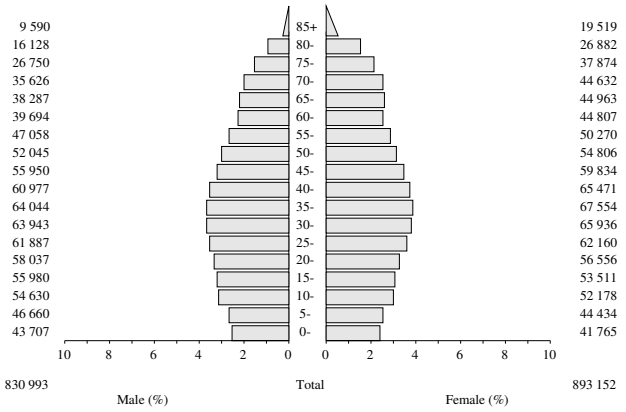
About 70 facilities (including 10 major hospitals and seven radiotherapy facilities) provide cancer treatment in the covered area.

REGISTRY STRUCTURE AND METHODS

The registry is located in the University of Catania Medical School and funded by the regional government. There are 15 staff members: a director, nine full- or half-time registrars, two informaticians, a statistician, a clerk responsible for archives and retrieving medical reports, and a secretary, as well as a scientific committee. The primary data sources are hospital discharge cards, death certificates, and histopathology reports; secondary sources include medical records, oncology and imaging reports, palliative care records, and information from general practitioners. The registry has centralized the flow of all data through an online portal. The registry's archives are digital, but mainly free of coding; cases are therefore abstracted semi-automatically and completed manually. Cases are checked using IARCcrgTools, DEPedits, and CheckAIRTUM software.

INTERPRETING THE RESULTS

Breast and cervical cancer screening programmes were introduced in 2000.



USE OF THE DATA

Data on the incidence and extent of disease of breast and cervical cancers are published nationally, and survival data will be published through the CONCORD-3 study. Local research typically focuses on National Priority Contaminated Sites and the so-called volcanic factor associated with Mount Etna.

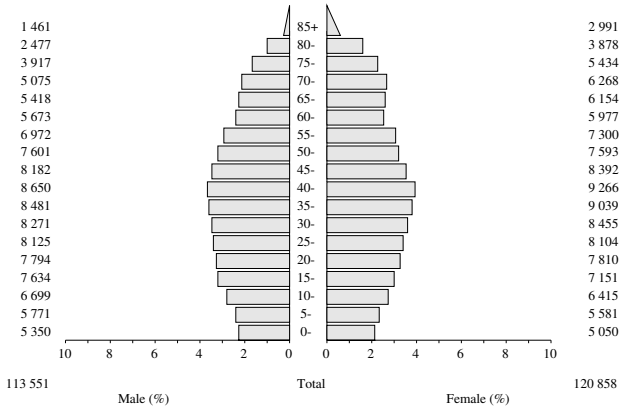
† See note following population pyramid

Italy, Catanzaro

REGISTRATION AREA
The Catanzaro Cancer Registry covers the province of Catanzaro in the Calabria region of Italy. The population is about 250 000 and is predominantly urban.

CANCER CARE FACILITIES
There are four oncology departments and two referral hospitals with radiotherapy facilities (both in the city of Catanzaro). There are various schemes of health insurance coverage.



REGISTRY STRUCTURE AND METHODS
The registry is located in and funded by a local health authority, which also employs the registry staff (a registry manager, two full-time staff members, and a pathologist advisor). The registry is currently the only one in Calabria accredited by the Italian network of cancer registries (AIRTUM). It was established in 2003 within the epidemiological service of the former Sanitary Agency no. 7 of Catanzaro. The Catanzaro Cancer Registry's data sources are hospital discharge cards, pathology reports, death certificates, clinical files, radiotherapy services, laboratories, oncology services, exemption records, social services records, screening centres, general practitioners and paediatricians, childhood cancer registrations, diagnostic imaging services, and municipal demographic and sanitary services. CanReg4 software was originally used to process the data, but was replaced by MCRDBLT software. Topography, morphology, and behaviour are coded using ICD-O-3. The registry follows the IARC/IACR and European Network of Cancer Registries (ENCR) rules for basis of diagnosis. For other definitions, the registry follows the AIRTUM *Cancer Registration Handbook*. Data are verified using the IARC-CHECK program. After being processed through four separate quality control procedures, data are verified a final time using CheckAIRTUM software.

INTERPRETING THE RESULTS
A national cancer control plan is mandated by law (Decreto Legge n. 179/2012). There have been no significant changes in incidence rates in recent years. The greatest challenges faced by the registry relate to the receipt of incomplete information from data sources and the high level of health mobility in the area.

USE OF THE DATA
Registry data are used for reporting incidence, extent of disease, and survival as well as for research and the planning and evaluation of health services.

Italy, Como

REGISTRATION AREA

The Cancer Registry of Como Province (RT-Como) covers the province of Como, which accounts for about 5.3% of the geographical area of the Lombardy region of Italy and is divided into 162 municipalities. Economic activity is dominated by small and medium-sized businesses, many with a strong artisanal character. Manufacturing (textiles, metalworking, and woodworking) is also prominent. The population is fairly stable but ageing. In 2012, the population was 593 000, with 454 residents/km^2. Foreign residents accounted for about 8% of the population (45% from Europe, 29% from Africa, and 16% from Asia).

CANCER CARE FACILITIES

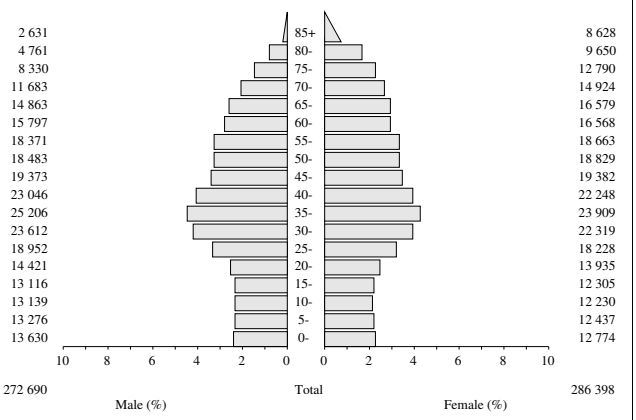
The province of Como has eight general hospitals, which provide all the main specialties of medical and surgical care, including oncology and radiotherapy. There are three pathology departments. About 36% of residents requiring cancer hospitalization are admitted to facilities outside the province.

REGISTRY STRUCTURE AND METHODS

RT-Como is located in the department of preventive medicine of the local health authority. It is staffed by an epidemiologist (who is also the registry director), two registry clerks, and a computer operator. RT-Como uses an automated cancer registration system called Open Registry, developed by the Milan National Cancer Institute. The registry's main electronic information sources are hospital discharge reports, pathology reports, and mortality data. About 50% of cases are automatically identified and accepted using Open Registry. For the remaining cases, clinical records are reviewed manually. Data completeness is monitored using capture–recapture methods. Clinical consistency is routinely checked.

INTERPRETING THE RESULTS

Organized screening was implemented for breast cancer (by biennial mammography) in 2004 and for colorectal cancer (by faecal immunochemical testing [FIT]) in 2006. Both programmes target residents aged 50–69 years. Opportunistic screening for cervical cancer is available. An artificial rise in the incidence of prostate and thyroid cancer may be due to inappropriate use of prostate-specific antigen (PSA) testing and ultrasound.



USE OF THE DATA

The registry publishes periodic reports on cancer incidence, mortality, and survival, and provides epidemiological support to clinicians. Registry data are also used for planning and evaluating health services and screening programmes.

Italy, Ferrara

REGISTRATION AREA

The Ferrara Province Cancer Registry covers the province of Ferrara, which is located in the Emilia-Romagna region of Italy, close to sea level. Ferrara is bordered to the east by the Adriatic Sea. In 2006, the employment rate (among residents aged 15–64 years) was 66.1% (60.5% in trades and services, 31.6% in industry, and 7.9% in agriculture). Mechanical and chemical industries, animal breeding, traffic, heating plants, and agricultural chemical treatments are the main sources of pollution. Since 2002, the population has increased, mainly due to immigration (particularly from eastern Europe, northern Africa, and Asia).

CANCER CARE FACILITIES

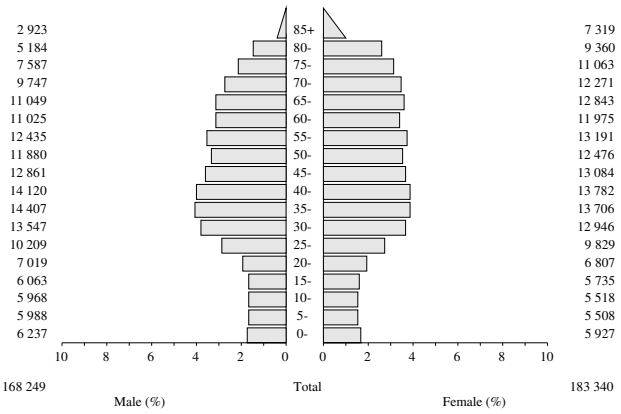
During the period covered, the province had three care districts with nine hospitals (with a total of 1842 beds in 2005). Clinical oncology, surgery, haematology, and radiotherapy services are available.

REGISTRY STRUCTURE AND METHODS

The registry is supported by the regional health authority and is located in the pathology department of the University of Ferrara. The staff consists of a director and three clerks. Data collection and quality control are performed according to IARC/IACR and European Network of Cancer Registries (ENCR) rules.

INTERPRETING THE RESULTS

Cigarette smoking and air pollution influence the traditionally high rates of lung cancer in Ferrara. Organized screening was implemented for cervical cancer in 1996 and for breast cancer in 1997. A colorectal cancer screening programme was started in 2005, which resulted in higher incidence rates of colorectal cancer. The incidence rates of prostate and thyroid cancers have also increased, mainly due to increased opportunistic screening.



USE OF THE DATA

In addition to providing descriptive epidemiological data, the registry is involved in evaluating the impact of screening programmes, by systematically registering premalignant lesions of the cervix (e.g. high-grade dysplasia and carcinoma in situ) and the colorectum (e.g. polyps, adenomas, and high-grade dysplasia). The registry also collaborates with the Italian network of cancer registries (AIRTUM) on studies of multiple tumours, rare tumours, haematological malignancies, and the prognostic and predictive power of biological assessment in breast cancer.

Italy, Florence and Prato

REGISTRATION AREA

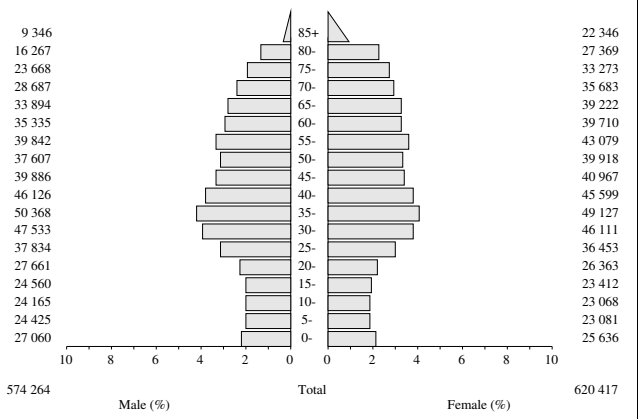
The Tuscany Cancer Registry (RTT) covers the provinces of Florence and Prato in the Tuscany region of Italy.

REGISTRY STRUCTURE AND METHODS

The RTT is funded by the Tuscany Region Department of Health and is associated with the Unit of Clinical and Descriptive Epidemiology of the Centre for the Study and Prevention of Cancer (CSPO) in Florence. Registration began in 1985. The registry was instituted by regional law, and notification is mandated by administrative order. The regional health authority provides public and private hospital admission files, which are abstracted from precoded electronic information. Pathology data have been received electronically since 1998. All data have been converted to ICD-O-3. Information about each tumour, including personal identifiers and full clinical details, is coded and registered. Patient names and other personal and clinical data are stored in separate files and linked by an identification number. Death certificates are received from the Regional Mortality Registry. Mortality data are periodically checked against the registry's records to identify cases not otherwise notified. Data are periodically verified using IARC tools and software developed by the Italian network of cancer registries (AIRTUM).

INTERPRETING THE RESULTS

Screening has been in place since the late 1990s, with compliance rates of 69% for mammography, 47% for cervical screening, and 52% for colorectal screening. A cohort of about 15 000 men (aged 55–69 years) was included in the European Randomized Study of Screening for Prostate Cancer (ERSPC). Prostate-specific antigen (PSA) testing is common in Tuscany, and about 25% of resident men aged more than 50 years had undergone PSA testing in 2004–2005.



USE OF THE DATA

RTT data are available from http://rtrt.ispo.toscana.it/rtrt/index.html. Data are also sent to the Italian Cancer Registries database. The RTT routinely participates in clinical and analytical epidemiological studies, and is improving the collection of clinical data for the evaluation of diagnostic and clinical patterns. The RTT participates in projects on cancer incidence, prevalence, and survival, such as EUROCARE, CONCORD, the Automated Childhood Cancer Information System (ACCIS), and RARECARE.

Italy, Friuli-Venezia Giulia

REGISTRATION AREA

The Friuli-Venezia Giulia Cancer Registry covers the Friuli-Venezia Giulia region of north-eastern Italy, which covers 7844 km^2. The population is 1.2 million, with 153.6 residents/km^2. The region is highly industrialized. It is bordered by the Adriatic Sea to the south, Slovenia to the east, and Austria to the east and north-east. About 80% of residents live in urban areas. The largest city, Trieste, has a population of 242 000.

CANCER CARE FACILITIES

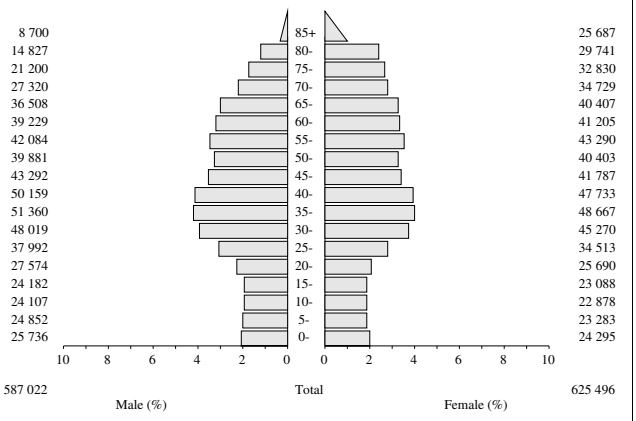
There are three regional public hospitals, six local public hospitals, and four private clinics in the region. Cancer patients are treated at the National Cancer Institute in the city of Aviano and in the oncology and radiotherapy departments of the regional public hospitals.

REGISTRY STRUCTURE AND METHODS

Region-wide cancer registration began in 1995 as part of the North East Cancer Surveillance Network. Since 2006, incidence data have been collected separately due to modified administrative procedures. Automated registration techniques are used with electronic diagnosis records, hospital records, and population archives. Manual techniques are still used for analysis of some electronic records and ascertainment of prevalent cases, as well as for quality control. The registry uses the IARC/IACR rules (2004) for multiple primary tumours.

INTERPRETING THE RESULTS

The registry data for 2003–2007 show two noteworthy trends in respiratory cancers: a consistent decline among men (from 63.2 cases per 100 000 men in 2003 to 49.3 in 2007) and a slight increase among women (from 15.8 cases per 100 000 women in 2003 to 18.5 in 2007), due to diverging time trends in smoking. Prostate-specific antigen (PSA) testing has been widely used for early diagnosis of prostate cancer, which was by far the most frequently diagnosed cancer among men, with 86.4 cases per 100 000 men in 2007 (up from 69.3 in 2002).



USE OF THE DATA

The registry's main task is planning surveillance and preventive programmes. Registry data are also used to carry out population-based evaluation studies and analytical investigations of the causes of cancer (e.g. dietary habits).

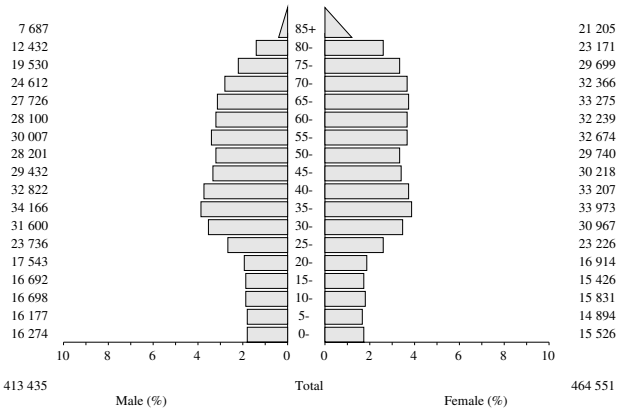
† See note following population pyramid

Italy, Genoa

REGISTRATION AREA
The Liguria Region Cancer Registry (LRCR) covers the province of Genoa in the Liguria region of north-western Italy. In 2009, the population was 883 000, with about 70% of residents living in the urban area of Genoa and 26.9% aged more than 65 years.

CANCER CARE FACILITIES
Most of the province's cancer care facilities are located in the city of Genoa. They consist of a comprehensive cancer centre, the National Cancer Research Institute (NCRI), and 16 public and four private hospitals with diagnostic, surgical, pathology, radiotherapy, and oncology units.



REGISTRY STRUCTURE AND METHODS
The LRCR is owned by the Liguria Region Health Councillorship and located within the descriptive epidemiology unit of the NCRI, which is also in charge of the Liguria Region Mortality Register (LRMR). The LRCR actively collects cases from the NCRI, 13 general hospitals, a teaching hospital, and five pathology laboratories. The registry also collects data on residents of the province of Genoa from hospitals in other provinces. The LRCR is staffed by eight full-time researchers, two coders, two employees who manage the pathology records and the computerized hospital discharge records provided by the Ligurian Health Informative System (including performing quality control and statistical analyses), three case registrars, and a clerk who performs follow-up on vital status. The staff is supported by a researcher from the LRMR, who helps identify death certificates associated with registered cases. Official mortality data are also provided by the Italian National Institute of Statistics (ISTAT).

INTERPRETING THE RESULTS
An organized mammography screening programme began in 2002. About 79 000 women aged 50–69 years were invited to have biennial two-view mammography. By the end of 2007, 50% of these women had undergone at least one mammogram.

USE OF THE DATA
The registry reports incidence and survival and participates in national and international high-resolution studies on quality of diagnosis and treatment.

Italy, Latina

REGISTRATION AREA

The Latina Province Cancer Registry is the only population-based cancer registry in the Lazio region of central Italy. The registry has covered the entire population of the province of Latina since it was instituted in 1983. At the 2011 census, the population of the province of Latina was 555 700 (272 400 males and 283 300 females). The province has an area of 2251 km^2 and is divided into 33 municipalities.

CANCER CARE FACILITIES

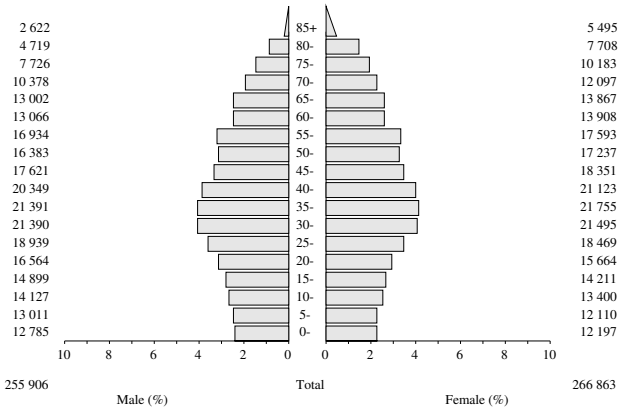
There are two referral hospitals in south-central Latina and a regional oncology centre in the north of the province. A radiotherapy facility serves the entire province. Public health insurance coverage is provided by the national health service.

REGISTRY STRUCTURE AND METHODS

Pathology laboratories are the most important data sources, but also the most difficult sources from which to collect cases, due to the large number of hospitalizations in other provinces of Lazio (45%) and outside of Lazio (2%). The registry has access to hospital discharge records for all residents. Through the mortality registry (ReNCaM), the Latina Province Cancer Registry also has access to all cancer-related death certificates for residents, including a copy of the original certificate. The registry collects clinical records from all the major hospitals in Latina and Rome, particularly from the oncology, haematology, and radiotherapy divisions. Data from the outpatient care/ drug consumption information system are available starting from 2006.

INTERPRETING THE RESULTS

Changes were observed mainly in relation to the initiation of organized screening for cervical cancer in 2002 and for breast cancer in 2004, and in relation to changes in the use of prostate-specific antigen (PSA) testing in 2000.



USE OF THE DATA

The registry published a report on incidence and survival for the period 2004–2008. Registry data are also used for research and for planning and evaluation of health services

Italy, Latina (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on data from the 2001 census, municipal population registries, and health office records, making allowances for births and deaths (but not migration).

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Italy, Lecco

REGISTRATION AREA

The Cancer Registry of Lecco Province covers the province of Lecco, which is located in the Lombardy region of northern Italy. The province has a population of 340 000 (after recently increasing by 9.1% over 10 years), an area of 814 km^2, and a population density of 416.8 residents/km^2. It is subdivided into 90 municipalities, only six of which have more than 10 000 residents. The provincial capital is the city of Lecco, which has a population of 48 000. The northern part of the province is mountainous and includes part of Lake Como. The southern part is more densely populated, with many small and medium-sized manufacturing companies (26% in metalworking) and heavy road traffic. The population is mainly Italian, with 5.7% foreign residents. The birth rate is 10.22 births per 1000 residents, the mortality rate is 8.57 deaths per 1000 residents, and the elderly index (the ratio of the population aged more than 64 years to the population aged less than 15 years, multiplied by 100) is 136.79. The average life expectancy at birth is 79.4 years for males and 84.2 years for females.

CANCER CARE FACILITIES

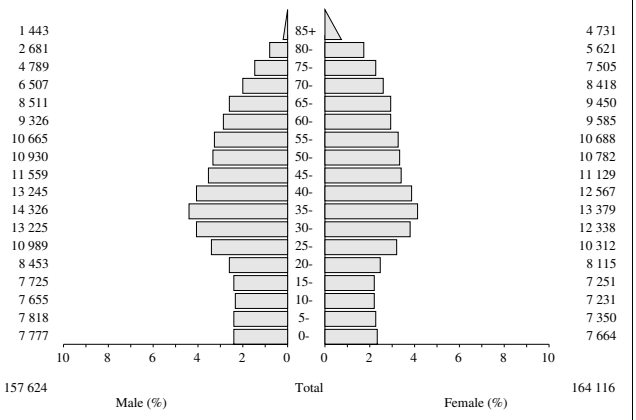
Three public hospitals and a network of primary health centres provide general health care in the province. Two hospitals provide cancer surgery, thoracic surgery, neurosurgery, haematology, radiotherapy, and chemotherapy. There are three accredited private hospitals. An integrated home care system was established in 1992.

REGISTRY STRUCTURE AND METHODS

The registry is part of the Research and Health Development Service in the Preventive Community and Medicine Department of the Lecco Local Health Authority. It is staffed part-time by two physicians and full-time by a nurse, and receives technical and scientific support from the Milan National Cancer Institute. The registry receives hospital discharge data on Lecco residents and uses the Open Registry automated registration system (Tagliabue et al., 2006) to identify records of cancer diagnosis/treatment and link them to other data sources (e.g. autopsy, pathology, and laboratory reports; medical records; and mortality files).

INTERPRETING THE RESULTS

Cancer screening programmes (with active invitation) are established in the province. In 2010, 72.4% of women aged 50–69 years underwent mammography and 56% of people aged 50–69 years underwent colorectal cancer screening.



USE OF THE DATA

Registry data are used to analyse cancer incidence and survival, and to evaluate and allocate health services.

Italy, Lombardy, South

REGISTRATION AREA

The Cancer Registry of South Lombardy covers the provinces of Lodi and Pavia, which are located in the southern part of the Lombardy region of northern Italy. Unlike the rest of Lombardy, the registration area is mainly agricultural, similar to the neighbouring regions of Piedmont and Emilia-Romagna. The registration area is 3747 km^2. It contains 252 municipalities (62 in Lodi and 190 in Pavia) and has a population of 783 000 (235 000 in Lodi and 548 000 in Pavia). Immigrants account for 10% of the population. Most residents (87.3% overall; 85.5% in Lodi and 87.9% in Pavia) live in small communities with populations of less than 5000. The elderly index (the ratio of the population aged more than 64 years to the population aged less than 15 years, multiplied by 100) is high (133 in Lodi and 189 in Pavia). Most of the registration area occupies the flat Po Plain, but 20% is hilly or mountainous. The mean population density is 209 residents/km^2 (280/km^2 in Lodi and 174/km^2 in Pavia).

CANCER CARE FACILITIES

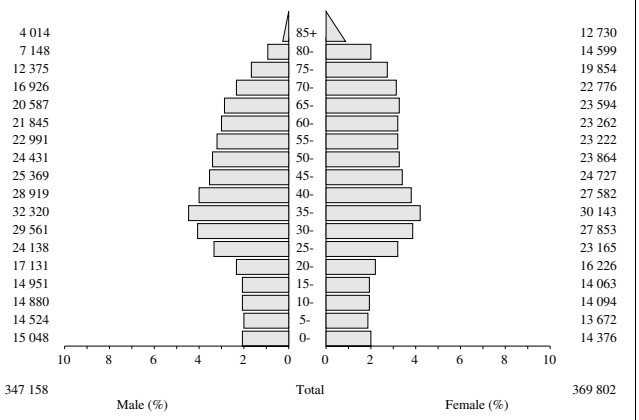
There are 23 hospitals in the registration area (four in Lodi and 19 in Pavia). There are 33 paediatricians in Lodi and 59 in Pavia, and there are 152 general practitioners in Lodi and 407 in Pavia.

REGISTRY STRUCTURE AND METHODS

The registry staff consists of three medical doctors, four other health professionals, an information technologist, and a statistician, all employed part-time. The registry also receives support from the Varese Province branch of the Lombardy Cancer Registry. The Cancer Registry of South Lombardy uses the Open Registry automated cancer registration system (Contiero et al., 2005). The registry's main electronic information sources are hospital discharge reports (routinely generated by all Italian hospitals), pathology reports from all laboratories within the two provinces and the major out-of-province laboratories that often examine specimens from Lodi and Pavia residents, and mortality data from local health authorities.

INTERPRETING THE RESULTS

The only significant factors that may affect incidence rates are a screening programme for breast cancer, which was started in October 2002 (and run intermittently during 2003–2005), and a screening programme for cervical cancer, which has been active since 2001.



USE OF THE DATA

The registry reports incidence, extent of disease, and survival statistics. Registry data are also used for planning and evaluation of health services and evaluation of screening programmes.

Italy, Mantua

REGISTRATION AREA

The Cancer Registry of Mantova Province covers the province of Mantua, which is located in the south-western part of the Lombardy region of northern Italy. As of 1 January 2006, the population was 394 000. The province's economy is based mainly on services (56%), industry (37%), and agriculture (7%). In 2005, the unemployment rate was 4.2% (compared with the national average of 7.7%), and foreign residents accounted for about 7% of the population.

CANCER CARE FACILITIES

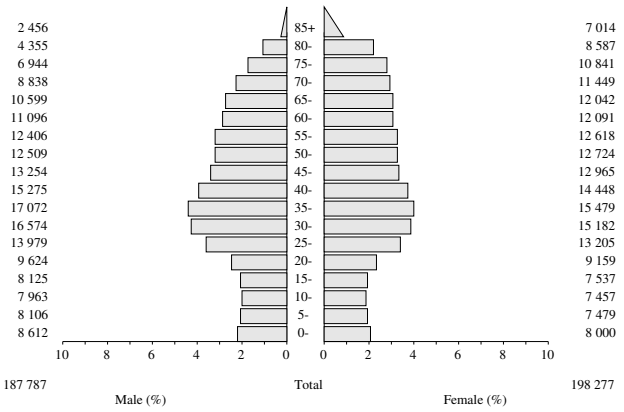
Cancer care is provided by four public and three private hospitals. The Hospital of Mantova provides all the main surgical and medical specialities, including medical oncology and radiotherapy services. About one third of hospitalized residents are admitted to academic centres of excellence either within the region (in Brescia, Milan, or Pavia) or outside the region (in Padua, Verona, Modena, Parma, Reggio Emilia, or Ferrara).

REGISTRY STRUCTURE AND METHODS

The registry is located within and funded by the Mantua Local Health Authority. The staff consists of the registry director (a physician), four health care assistants, a statistician, and an administrator. The registry has collected all cancer cases since 1999. It has full access to all hospital discharge records for residents of the province, and to the reports released by pathology laboratories. The registry also receives records from the local mortality registry. The regional government supplies copies of the population files for reference in linking source records, which are evaluated using a case-resolution program. Completeness and accuracy are evaluated, and duplicate and quality control checks are run periodically. The proportion of death-certificate-only (DCO) cases is less than 2%.

INTERPRETING THE RESULTS

Cancer incidence rates in the province of Mantua are similar to those in other provinces of the Lombardy region. There are no known unusual environmental or occupational exposures in the registration area that would affect incidence. Screening was initiated for cervical cancer in 1980, for breast cancer in 2001, and for colorectal cancer in 2005. The registry collaborates with the screening service that administers these programmes.



USE OF THE DATA

The registry is part of the Italian network of cancer registries (AIRTUM) and submits data to the Italian Cancer Registries database. It also publishes periodic reports on incidence, mortality, and survival, and participates in clinical and analytical epidemiological studies.

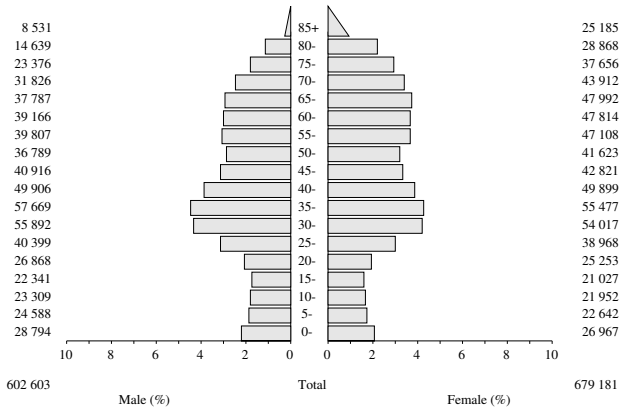
Italy, Milan

REGISTRATION AREA
The Milano Cancer Registry covers the city of Milan, which is the largest metropolitan city in northern Italy and is the capital of both the province of Milan and the Lombardy region. The city covers a total area of 182 km^2. At the 2011 census, the population was 1.3 million, with 6826 residents/km^2. A single local health authority serves the entire registration area.

CANCER CARE FACILITIES
There are 29 hospitals in the registration area, each of which provides the registry with full access to case information.



REGISTRY STRUCTURE AND METHODS
The registry was established in May 2002 and is located within the epidemiology unit of the Local Health Authority of Milan. Its staff consists of three medical epidemiologists, two statisticians, and five nurses working as cancer registrars. The registry uses automated cancer registration methods. The population roster, death certificates, hospital discharge records, and pathology reports are fed into the registry's information system, and underlying causes of death and hospital admission diagnoses are coded using ICD-9. Incidence topography is coded using ICD-10, and morphology is coded using ICD-O-3. Cases are followed up annually to determine survival using consolidated record linkage between the registry database and the municipal census office.

INTERPRETING THE RESULTS
There are breast and colorectal cancer screening programmes in the registration area.

USE OF THE DATA
Policy-makers use registry data to evaluate health care and treatment policies and to plan prevention activities. Registry data are also used to study differential cancer risks within the population (which includes a relatively high proportion of immigrants) and to plan differential preventive actions accordingly. The registry supports etiological research, and registry data are used to evaluate the city's screening programmes.

Italy, Modena

REGISTRATION AREA

The Modena Cancer Registry (MCR) covers the province of Modena in the Emilia-Romagna region of northern Italy. In 2005, the population was 665 000. The province has 47 municipalities.

CANCER CARE FACILITIES

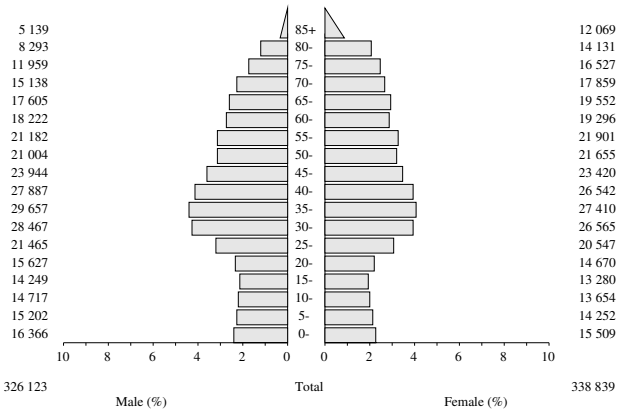
There are nine public general hospitals (including a university teaching hospital) and five private clinics.

REGISTRY STRUCTURE AND METHODS

The MCR is located within the cancer centre of the University of Modena and Reggio Emilia. It is supported by the local health authority and the Angela Serra Association for Cancer Research. The staff consists of a medical director, a research manager, a statistician, a systems manager, two registrars, and a secretary. The main data sources are reports from one pathology laboratory and one haematology laboratory, hospital discharge records, and death certificates. These files are submitted to the registry periodically and are processed using specialized software. Each case is manually checked and validated by MCR registrars. Vital status is passively followed up by matching registered cases with death notifications and public health database records. For cases that cannot be matched passively (less than 1%), vital status is followed up actively.

INTERPRETING THE RESULTS

During 2003–2007, there was a trend of decreasing cancer incidence for all tumour sites among male residents of Modena, whereas there was a trend of increasing incidence among female residents. The overall decrease among males is primarily due to decreasing incidence rates of respiratory tract and stomach cancers. The overall increase in incidence among females is probably due to increased incidence rates of cancers at sites such as the uterus, lung, and thyroid. The incidence of thyroid cancer increased in both sexes, possibly as a result of earlier diagnosis due to increased rates of examination after goitre surgery, as well as earlier diagnosis of thyroid microcarcinoma. At tumour sites covered by screening programmes (the breast and cervix) a trend of decreasing incidence has continued. For colorectal cancer, it is still too early to detect any beneficial effects of the screening programme established in 2005.



USE OF THE DATA

The MCR publishes an annual report on cancer incidence, mortality, and survival. The population data used in these reports are obtained from the Emilia-Romagna region's online portal (http://statistica.regione.emilia-romagna.it/servizi-online). All registry publications are available from the MCR's website. The registry collaborates on many national and international high- and low-resolution studies.

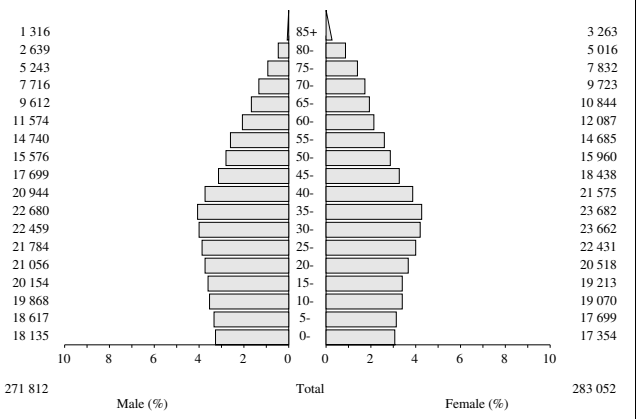
Italy, Naples

REGISTRATION AREA
The Campania Cancer Registry covers 35 municipalities in the northern part of the province of Naples, which is located in the Campania region of southern Italy. The area is economically depressed, and its population is characterized by a high percentage of young people, with 19% of the population aged less than 15 years and 41% aged less than 30 years.

CANCER CARE FACILITIES
The registration area has two public general hospitals with chemotherapy services, one pathology laboratory, and one private radiotherapy centre operating within the national health service. About 10% of patients travel to central and northern Italy to receive health services.



REGISTRY STRUCTURE AND METHODS
The registry is staffed by a physician, an informatics technician, and four social workers. Data are actively collected from pathology laboratories, hospital discharge cards, and mortality records. General practitioners in the registration area are consulted about cases that are first notified by death certificate. Registry staff members have access to official mortality statistics and individual death certificates mentioning cancer.

INTERPRETING THE RESULTS
There are organized population screening programmes for cervical and breast cancer, but participation rates are low (17% and 23%, respectively). There has been a widespread increase in prostate-specific antigen (PSA) testing since 2003. The high prevalence of infection with hepatitis B and C viruses in the area (2% and 7%, respectively) is related to high incidence rates of hepatocellular carcinoma.

USE OF THE DATA
The registry publishes periodic reports on cancer incidence, prevalence, mortality, and survival, and also collaborates with public health organizations in the planning and evaluation of cancer services.

† See note following population pyramid

Italy, Nuoro

REGISTRATION AREA

The Nuoro Cancer Registry covers the province of Nuoro in the central-eastern part of the autonomous region of Sardinia in Italy. Due to administrative changes, the provincial population has been reduced from 263 000 to 220 000 since 2006. The province's economy is based on farming, trade, the construction industry, and tourism.

CANCER CARE FACILITIES

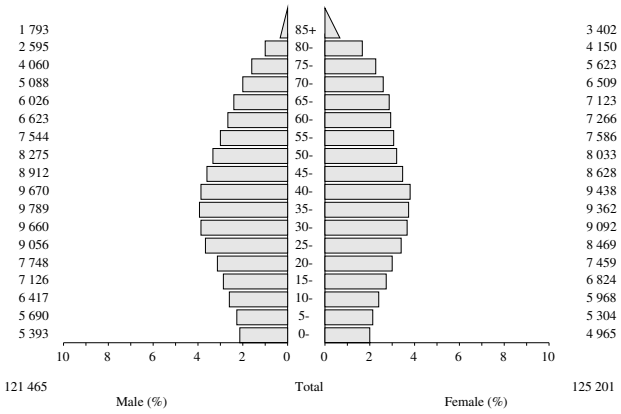
Cancer care is provided by five hospitals (including the Hospital of Nuoro), with about 500 beds. All the main surgical and medical specialities are available, including haematology-oncology and radiotherapy services. Many clinics are located throughout the districts of the province. Cancer service providers are part of the regional cancer network.

REGISTRY STRUCTURE AND METHODS

The registry is funded by the local health authority (ASL Nuoro) and also has a partnership with the local health authority of Lanusei. The staff consists of six physicians and a health care technician. The registry has collected all cancer cases in the province since 2003, although the relatively high number of cancer patients hospitalized outside the province creates many problems with case finding. The registry has full access to all records of patients residing in the province and to hospitals' pathology reports. It also receives records from the local mortality registry. Each registry case file is enriched with data required for complete definition. All data are stored digitally in compliance with Italian privacy law. Completeness and accuracy are evaluated, and duplicate and quality control checks are run periodically.

INTERPRETING THE RESULTS

Liver cancer is relatively common in the registration area, which may be due to the prevalence of infection with hepatitis B and C viruses and the heavy alcohol consumption in the province.



USE OF THE DATA

The registry is part of the Italian network of cancer registries (AIRTUM) and submits data to the Italian Cancer Registries database. It also publishes periodic reports on incidence, mortality, and survival, and participates in clinical and analytical epidemiological studies.

Italy, Palermo

REGISTRATION AREA

The Palermo Province Cancer Registry (PPCR) covers the province of Palermo in the north-western part of the autonomous region of Sicily in Italy. The province has a population of 1.2 million and an area of 4992 km^2 (resulting in a population density of 248.1 residents/km^2). Trade and service activities are mainly carried out in the metropolitan area of the city of Palermo, which is the provincial capital. Farming and fishing are prevalent throughout the rest of the province. Shipbuilding is an important industry. The population is stable and young; 17% of residents are aged more than 65 years. Most of the population is Caucasian, and Catholicism is the prevalent religion.

CANCER CARE FACILITIES

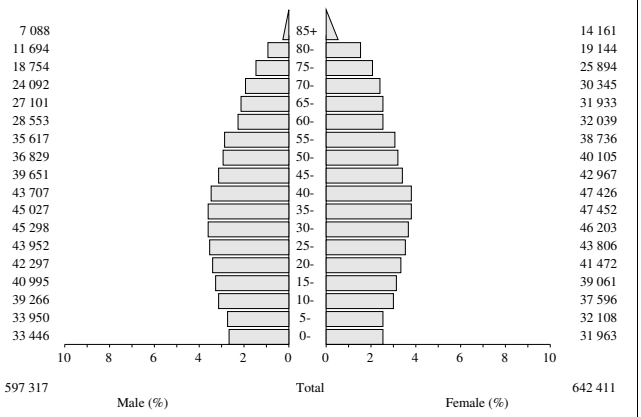
Health care services are provided by 14 district hospitals, 11 other hospitals, and 12 private clinics, located predominantly in the city of Palermo and including three oncology departments, three radiotherapy departments, and one haematology service with a transplant unit.

REGISTRY STRUCTURE AND METHODS

The registry was established in 2003 by the Sicilian government. Its staff consists of a director, an epidemiologist, seven registrars, three statisticians, and three clerks. The registry is part of the regional health information system and is subject to the relevant privacy legislation. The main sources of information are discharge diagnoses, pathology records, and death certificates. Additional information is obtained from medical records and general practitioners. Data collection is both active and passive.

INTERPRETING THE RESULTS

Because cancer care facilities are available locally, few residents travel to receive treatment elsewhere. The quality of the registry data is periodically verified using IARC tools and software developed by the Italian network of cancer registries (AIRTUM). Incidence rates are similar to those in other areas of southern Italy, with relatively high rates of liver and thyroid cancers. A breast cancer screening programme was started in 2004.



USE OF THE DATA

Registry data are used to survey cancer incidence throughout the registration area, to inform local cancer control strategies, and for the evaluation of health services.

Italy, Parma

REGISTRATION AREA

The Parma Cancer Registry (PCR) covers the province of Parma in the Emilia-Romagna region of northern Italy. The province has an area of 34 449 km^2 and is divided into 47 municipalities. The largest municipality and the provincial capital is the city of Parma. In 2003, the population of the province was 397 000, but has since grown rapidly, with the proportion of foreign residents increasing from 4.8% to 8.1%, with most coming from the Republic of Moldova, Albania, Romania, Morocco, and Tunisia. In 2008, the employment rate was 71.1%. About 58% of employed residents work in the service sector, 38.5% in the industrial sector, and 3.5% in agriculture.

CANCER CARE FACILITIES

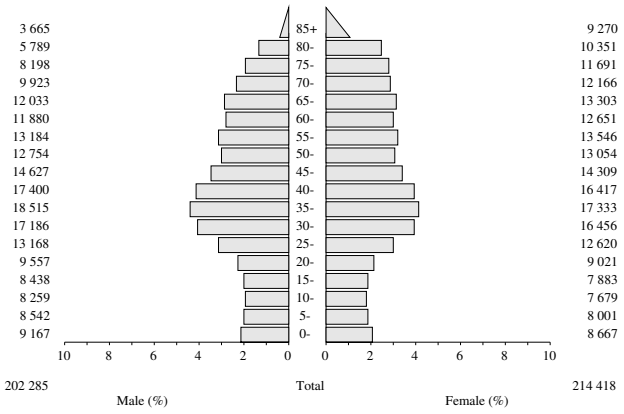
There is one large general university hospital, two small public hospitals, and three private hospitals. The university hospital has oncology, radiotherapy, haematology, paediatric oncology, and pathology departments.

REGISTRY STRUCTURE AND METHODS

The PCR was founded in 1976 and started official registration activity in 1978. It is located within the medical oncology division of the province's general university hospital. The staff consists of an oncologist (the registry director), a statistician, and a full-time biologist. The registry has direct access to public pathology records, and private hospitals submit electronic data annually. For hospital discharges that occur outside the province, diagnosis data are obtained through an official request to the department's director. Vital status is easily followed up through direct access to the local health authority's electronic database. Data collection is both active and passive. Personally identifiable information is protected in compliance with Italian law. Regular maintenance is carried out on the electronic database.

INTERPRETING THE RESULTS

There are three screening programmes in the province. Screening was initiated for breast cancer in 1997 (among women aged 50–69 years), for cervical cancer in 1998 (among women aged 24–67 years), and for colorectal cancer in 2005 (among residents aged 50–69 years).



USE OF THE DATA

The PCR collaborates with the Italian network of cancer registries (AIRTUM) and local health authorities on various research projects and epidemiological studies.

Italy, Ragusa

REGISTRATION AREA

The Ragusa Cancer Registry (RCR) covers the province of Ragusa, a rural area in the south-eastern part of the autonomous region of Sicily in Italy. The population is 310 000. The proportion of immigrants (mainly from northern Africa) has increased to about 5%.

CANCER CARE FACILITIES

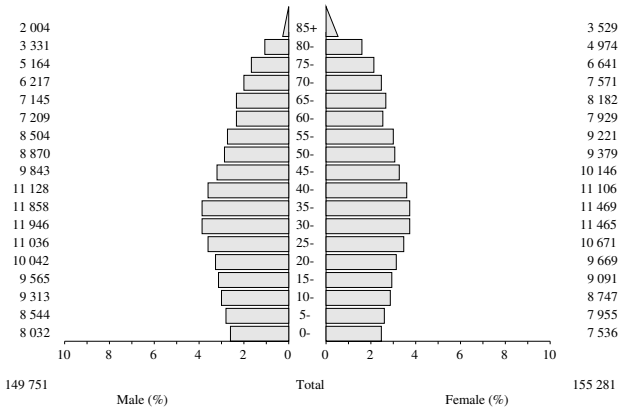
Cancer care is provided by one large hospital and one local health authority, which includes four small public hospitals, one private hospital, and 350 general practitioners. There are three public imaging facilities, two public surgical pathology laboratories, one oncology department, and one radiotherapy unit.

REGISTRY STRUCTURE AND METHODS

The registry is permanently staffed by a half-time medical pathologist (the registry director) and a full-time social worker. The non-permanent staff consists of 11 collaborators who perform active case finding and registration, and one who serves as an administrative clerk. The RCR is responsible for mesothelioma registration throughout Sicily. The registry is funded by the Sicilian government and AIRE-ONLUS Ragusa.

INTERPRETING THE RESULTS

Compared with earlier years, a larger proportion of patients received surgical treatment in nearby hospitals during this reporting period; this caused some delay in case finding, but extra work and capture–recapture procedures have been implemented to ensure completeness. Overall, cancer incidence in Ragusa, with its Mediterranean lifestyle and unpolluted environment, is lower than that in northern Italy. Survival has increased for almost all cancer, despite the lack of organized population-based screening programmes. The increased prostate cancer incidence is associated with an increase in prostate-specific antigen (PSA) testing. Despite recent improvements (due to increased numbers of care facilities, new drugs, and increased awareness), a notable survival gap compared with northern Italy persists.



USE OF THE DATA

RCR data are included in data published by the Italian network of cancer registries (AIRTUM), and the RCR is a collaborating centre for studies such as the European Prospective Investigation into Cancer and Nutrition (EPIC), EUROCARE, and CONCORD.

Italy, Reggio Emilia

REGISTRATION AREA

The Reggio Emilia Cancer Registry covers the province of Reggio Emilia, which is located in the Emilia-Romagna region of north-eastern Italy and is divided into 45 municipalities. The provincial capital is the city of Reggio Emilia, which has a population of about 157 000. In 2005, the total population of the province was about 495 000. The proportion of foreign residents has increased in recent years; in 2005, foreign residents accounted for 9% of the population. Most foreign residents come from northern Africa, eastern Europe, or south-central Africa. The province is highly industrialized. The principal industries are the mechanics and ceramic tile industries, but agriculture and cow and pig breeding are also important. Until the late 1980s, some of the most important Italian asbestos-cement factories were active in the province.

CANCER CARE FACILITIES

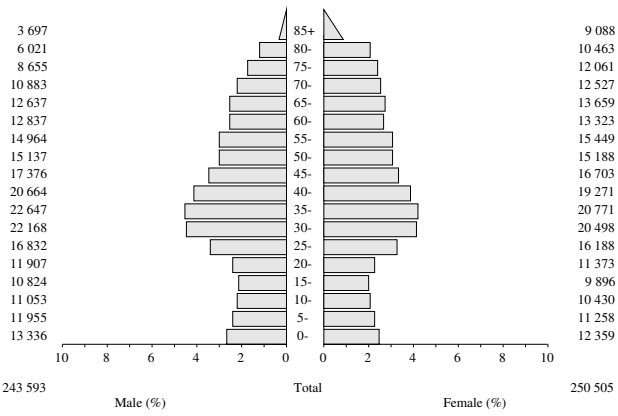
The province has six public hospitals (one per health care district), two hospices, and two certified private hospitals. The main hospital is the Arcispedale Santa Maria Nuova Clinical Cancer Research Institute in the city of Reggio Emilia, which has oncology, radiotherapy, digestive endoscopy, nuclear medicine, dermatology, haematology, and pathology departments. There is also a medical oncology unit and a palliative care unit in each health care district.

REGISTRY STRUCTURE AND METHODS

The registry is located within the epidemiology service of the provincial health care authority.

INTERPRETING THE RESULTS

There are three screening programmes (for breast, colorectal, and cervical cancers) in the province.



USE OF THE DATA

The registry's main purpose is to monitor the occurrence of cancer, but it also conducts epidemiological and clinical studies and participates in national and international multicentre studies.

Italy, Romagna

REGISTRATION AREA

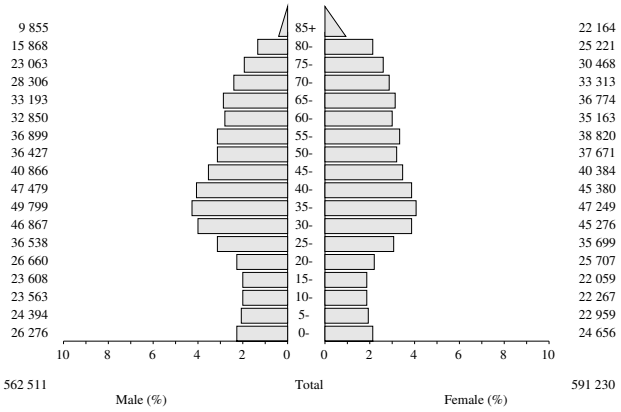
The Romagna Cancer Registry covers the provinces of Forlì-Cesena, Ravenna, and Rimini, as well as the neighbouring district of Imola in the province of Bologna, which are all situated in the Emilia-Romagna region of north-eastern Italy. The registration area covers 4769 km^2 and has a population of 1.2 million. Most residents are Caucasian, and there are relatively few immigrants. The area is socioeconomically homogeneous.

CANCER CARE FACILITIES

The registration area has 13 public hospitals and 15 certified private hospitals. Cancer care is provided by medical oncology departments and cancer screening centres at hospitals in the towns of Ravenna, Forlì, Cesena, Rimini, Lugo, and Faenza, and is coordinated at the Scientific Institute of Romagna for the Study and Treatment of Cancer (IRST) in the towns of Meldola and Forlì.

REGISTRY STRUCTURE AND METHODS

The registry was founded in 1985. It has since become a unit of the IRST, which was established in 2007 with the mission of improving the main specialist fields of cancer care throughout central Italy and the regions bordering the Adriatic Sea, and of achieving maximum efficiency with the available resources. The IRST is also responsible for basic research programmes and activities that the local health authority cannot undertake. The registry's main information sources are histology and cytology reports, hospital discharge forms, outpatient records from medical oncology departments, records from private clinics, and death certificates provided by public health departments and local health authorities.



USE OF THE DATA

Registry data have been used for several cohort and case–control studies (mainly studies investigating the relationships between diet and digestive tumours, diet and breast cancer, and pesticides and haematopoietic malignancies). The registry participates in numerous studies conducted by the Italian network of cancer registries (AIRTUM). It also actively contributes to local cancer control strategies coordinated by the IRST, both by conducting situation analyses (such as studies of the patterns of stage, diagnosis, and treatment of major malignancies) and by monitoring cervical, breast, and colorectal cancer screening programmes.

SOURCE OF POPULATION

Based on data provided online by the Emilia-Romagna regional government, which collects and processes annual data from all municipal population registries in the region.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Italy, Salerno

REGISTRATION AREA

The Salerno Cancer Registry (SCR) covers the province of Salerno, the largest province in the Campania region of Italy. Salerno has an area of 4922 km^2 and is divided into 158 municipalities. At the 2011 census, the population was 1.1 million. The province is bordered by the Tyrrhenian Sea to the west, the provinces of Naples and Avellino to the north, and the province of Potenza to the south-east. The geography of Salerno is diverse; 45% of the area is inland hills, 29% is mountains, 15% is coastal hills, and 11% is plains. There is a densely populated urban and industrial area in the north, a large rural area in the south, coastal settlements in the west, and mountain villages in the east.

CANCER CARE FACILITIES

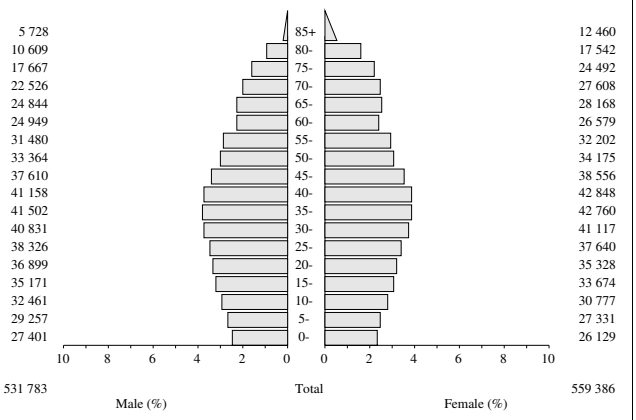
The registration area has 15 public hospitals that provide cancer surgery and haematology, radiotherapy, and chemotherapy services. Microscopic verification is provided by four pathology services. There are eight private hospitals.

REGISTRY STRUCTURE AND METHODS

The SCR began its activity in 1996, supported by the provincial government. It is staffed by a director, a data collection coordinator, an information technology manager, two full-time registrars, and five part-time employees. Almost all sources of information (pathology reports, hospital discharge forms, and death certificates) are submitted electronically. Compared with cancer registries in northern Italy, the SCR has a higher proportion of cases diagnosed and treated in hospitals outside the covered area. To ensure data completeness, the registry actively collects hospital discharge forms and pathology reports from these hospitals. The use of a population data file prevents double registrations. Vital status is followed up by annual linkage with the mortality registry and through active research.

INTERPRETING THE RESULTS

Incidence rates may be influenced by different risk factors among people living in the urbanized north and the rural south. A population-based screening programme for breast cancer was recently implemented and is expected to affect breast cancer incidence data starting from 2010.



USE OF THE DATA

The registry periodically provides reports on incidence, mortality, and survival to general practitioners, public health professionals, and epidemiologists. Registry-specific and collaborative studies on survival, dietary risk factors, and other risk factors are in progress.

Italy, Sassari

REGISTRATION AREA

The Sassari Cancer Registry (SCR) covers the province of Sassari in the autonomous region of Sardinia in Italy. At the 2001 census, the population was 454 000, and the 2009 intercensal estimate was 491 000. The province has an area of 7520 km^2 and a population density of 65 residents/km^2. The population is not evenly distributed: 51% of residents live in urban areas and 49% in rural areas. With few exceptions, the population is ethnically and culturally homogenous. The main economic industries are agriculture and tourism.

CANCER CARE FACILITIES

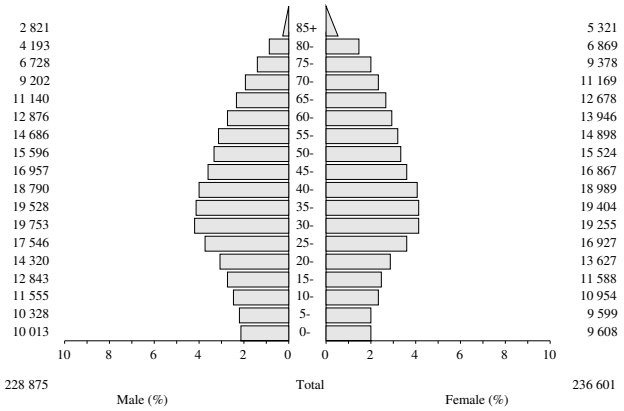
General health care is provided through the national health service by one regional and four district hospitals and primary health centres. Additional health care is provided by private practitioners. The province's oncology department (located in the regional hospital in the city of Sassari) provides diagnostic services, cancer surgery, and chemotherapy and radiotherapy services.

REGISTRY STRUCTURE AND METHODS

The SCR has collected all cancer cases occurring in the province since January 1992, including all cases of tumours with ICD-9 codes 140–208 and malignant and benign intracranial and spinal neoplasms. Carcinoma in situ cases are also collected but are not used to calculate incidence, except for urinary bladder carcinoma. Cases with insufficient detail are registered only when the evidence is clear or when diagnosis is made at the time of death. The registry receives hospital discharge records, biopsy reports, and death certificates. The SCR registrars also review the medical records of hospital departments involved in the diagnosis and treatment of cancer.

INTERPRETING THE RESULTS

There are an adequate number of hospitals and diagnostic facilities distributed throughout the registration area, so it is unlikely that a referred case will be missed. There are screening programmes for breast and cervical cancer.



USE OF THE DATA

The registry publishes an annual report on cancer incidence (highlighting changes and rare tumours) and 5-year survival rates. Registry data have also been used by the regional government to help design cancer control plans.

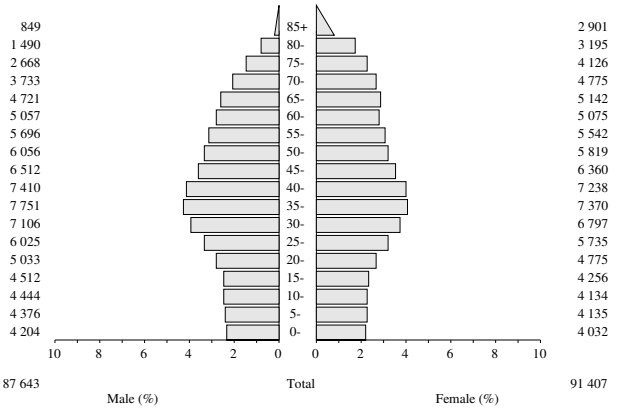
† See note following population pyramid

Italy, Sondrio

REGISTRATION AREA
The Sondrio Cancer Registry covers the province of Sondrio in the Lombardy region of northern Italy. The province is predominantly mountainous, but about 68% of residents live close to sea level. Most residents live in rural areas or small towns.

CANCER CARE FACILITIES
General health care is provided through the local health authority by four public hospitals and a network of primary health centres. The hospitals provide cancer surgery, thoracic surgery, and neurosurgery, as well as haematology, radiotherapy, chemotherapy, and imaging services. About 15% of cancer patients are referred to hospitals in Milan, 120 km away.



REGISTRY STRUCTURE AND METHODS
The registry is located within and financially supported by the local health authority. It is staffed by two full-time medical doctors (epidemiology specialists), a full-time nurse (the registrar), and a part-time informatics specialist. The registry receives all Italian hospital discharge data on residents of the province, as well as precoded data from pathology laboratories and mortality databases. Registry staff members review all records involving cancer diagnosis or treatment and recode all cases. They also review uncertain cases reported by radiotherapy and chemotherapy services. When cases are first notified by death certificate, the registry contacts the practitioner for further information. Quality control procedures include evaluations of death-certificate-only (DCO) cases, external comparisons with other registries, and capture–recapture analysis with independent databases (such as those of the Italian National Registry of Mesotheliomas and the Italian Association of Hematology and Oncology). The registry began collecting incident cases in 1998.

INTERPRETING THE RESULTS
The population of the registration area is stable. No changes in the availability of diagnostic or treatment services have been detected, and there have been no changes in definition or coding. Population-based screening was initiated for breast cancer in 2000 (among women aged 50–69 years, with 78% coverage) and for colorectal cancer in 2005 (among residents aged 50–69 years, with 60% coverage).

USE OF THE DATA
The registry regularly publishes reports on cancer incidence and survival. Registry data are also used for the evaluation of health services.

Italy, South Tyrol

REGISTRATION AREA

The South Tyrol Cancer Registry covers the autonomous province of South Tyrol, the largest province in Italy, with an area of 7400 km^2. In 2007, the population was 494 000, with 67 residents/km^2. The province is completely mountainous and is divided into 116 municipalities, of which only one has more than 100 000 residents (the city of Bolzano, with a population of 100 600). South Tyrol is trilingual; the majority of residents (62%) primarily speak German, 23% primarily speak Italian, and 4% Ladin. About 10% of residents are immigrants, who primarily speak other languages.

CANCER CARE FACILITIES

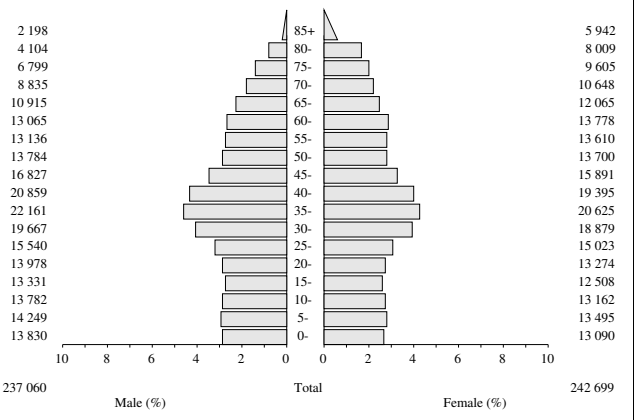
The province's seven public hospitals provide a total of 2046 beds, and private hospitals provide an additional 413 beds, for an overall rate of 5 beds per 1000 residents. A small proportion of cancer patients are treated outside the region, mostly in Innsbruck, Austria.

REGISTRY STRUCTURE AND METHODS

The registry was instituted in 1992 by the provincial government as a unit of the Histopathology Service of Bolzano and began its activity in 1995. Every case (whether reported or automatically detected) is subjected to several quality checks. All cases are coded using ICD-O-3 and checked using IARC software. The registry uses the IARC/IACR rules for multiple primary tumours. The registry has access to all death certificates issued in the registration area. The trace-back procedures recommended by IARC are always used before registering a case as death-certificate-only (DCO).

INTERPRETING THE RESULTS

There are three active screening programmes in South Tyrol. Screening was initiated for cervical cancer in 2001 (for women aged 23–65 years), for breast cancer in 2003 (for women aged 50–69 years), and for colorectal cancer in 2012 (for residents aged 50–69 years). Breast and cervical cancer incidence rates may be influenced by screening, and the increasing incidence rates of prostate cancer and melanoma may reflect increases in early diagnosis due to the widespread use of prostate-specific antigen (PSA) testing and voluntary screening, respectively.



USE OF THE DATA

The registry has been a member of the Italian network of cancer registries (AIRTUM) since 2001, and data from South Tyrol are published both in aggregate form and in comparison with data from other registries. Cancer burden estimates are used to support regional health authority programming.

† See note following population pyramid

Italy, Syracuse

REGISTRATION AREA

The Siracusa Province Cancer Registry covers the province of Syracuse, which is located in the south-eastern part of the autonomous region of Sicily and is divided into 21 municipalities. About 25% of the population is rural and 75% is urban. Most of the population is Caucasian, and Catholicism is the prevalent religion.

CANCER CARE FACILITIES

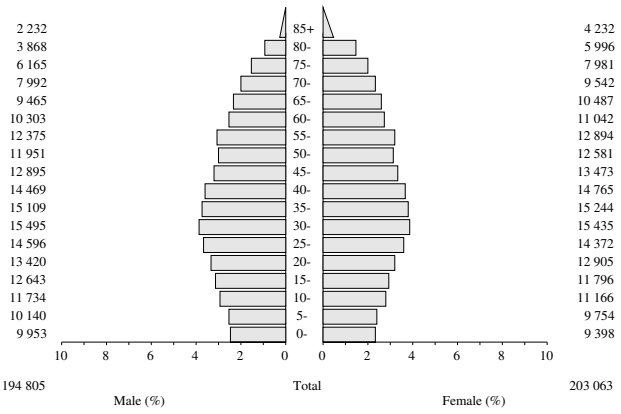
There are five public hospitals, five certified private hospitals, and 392 general practitioners. Two hospitals have medical oncology units with chemotherapy services. There are no radiotherapy services. Many patients travel to hospitals in Catania or northern Italy for diagnosis and treatment.

REGISTRY STRUCTURE AND METHODS

The registry is staffed by one full-time and two part-time epidemiologists, a full-time nurse, and a full-time registrar (a health worker). Cancer registration is voluntary and based on active case finding. Trace-back is performed for cases of unspecified behaviour, of unknown primary site, with outpatient records as the only source, or with other missing information, as well as for death certificate notifications. Trace-back procedures include contacting the physician and re-screening the data. Personal data are protected in compliance with Italian law.

INTERPRETING THE RESULTS

Population-based screening programmes for breast cancer and cervical cancer were implemented in 2001, but only covering the city of Syracuse (the provincial capital). The breast cancer screening programme was suspended in 2004 and resumed in some municipalities in 2012. A province-wide screening programme for colorectal cancer has been active since 2011. The environmental and occupational exposures present in the province are those typical of areas with large petrochemical plants.



USE OF THE DATA

The registry reports its data and collaborates with other Italian institutes and registries to investigate research topics such as the relationship between environment and health in the area and the impact of screening programmes within the population.

Italy, Trapani

REGISTRATION AREA

The Trapani Cancer Registry covers the province of Trapani, which is located in the west of the autonomous region of Sicily in Italy. At the 2001 census, the covered population was 425 000. The province of Trapani is divided into 24 municipalities and includes the volcanic Aegadian Islands and the island of Pantelleria. Trapani is one of the most urbanized provinces in Sicily, with about 149 000 households and a population density of approximately 167 residents/km^2. However, the province is still mainly rural, with few industrial sites or areas of high environmental risk. The population is primarily Catholic, and 19% of residents are aged more than 64 years.

CANCER CARE FACILITIES

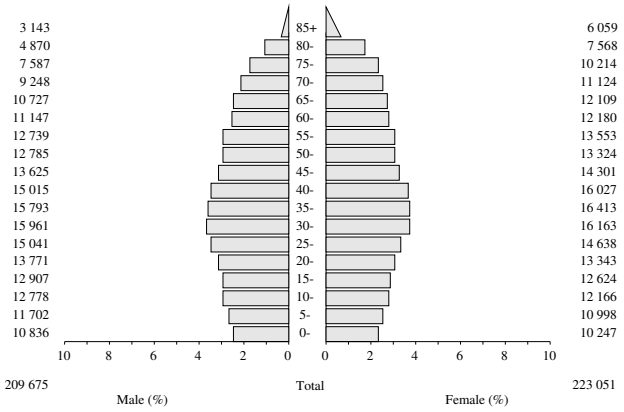
There are seven hospitals (two with pathology departments), two private clinics (with external pathology services), and three medical oncology services, but no radiotherapy services. Italy's national cancer control plan provides high diagnostic and therapeutic standards nationwide.

REGISTRY STRUCTURE AND METHODS

The registry was established in February 2003 and is part of the Italian network of cancer registries (AIRTUM). The registry's legal framework includes national and regional laws that establish the registry as a tool for monitoring population health and specify the registry's source of funding. The registry staff consists of a medical director and three external consultants (two biologists and a food technologist). Data collection is mainly active, with few passive notifications. The coded data are recorded using dedicated software and checked with CheckAIRTUM and IARC-CHECK software. Registry data are geocoded to facilitate the analysis of registration results.

INTERPRETING THE RESULTS

There are no known unusual environmental or occupational exposures in the registration area. The main factor that could influence incidence rates is the recent initiation of organized screening programmes for cervical, colorectal, and breast cancers.



USE OF THE DATA

Registry data are periodically published and are used in AIRTUM research and in regional studies.

† See note following population pyramid

Italy, Trento

REGISTRATION AREA

The Trento Cancer Registry covers the autonomous province of Trentino in Italy. Trentino is mostly mountainous. Trento (the capital city) has a population of 115 000. The presence of industry is limited. The services sector, particularly tourism, is the major economic industry. In previous editions of *Cancer Incidence in Five Continents* (Volumes VIII and IX), Trento Cancer Registry data were included in the data from the North East Cancer Surveillance Network (NEICSAN), together with data for the province of South Tyrol (also called Bolzano) and the Friuli-Venezia Giulia region.

CANCER CARE FACILITIES

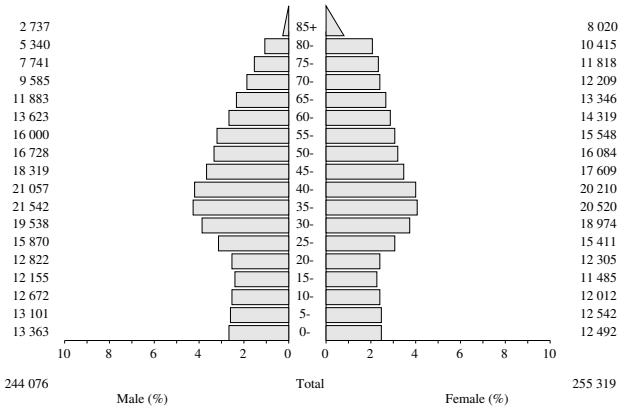
Trentino has 11 local health districts of various sizes. Hospital services are provided by seven public hospitals and six private clinics. Cancer patients are generally treated at Santa Chiara Hospital in the city of Trento, which has oncology and radiotherapy departments. A small proportion of cancer patients (particularly children and patients with haematological malignancies) are treated outside the province.

REGISTRY STRUCTURE AND METHODS

The registry is located within the epidemiology department of Trentino's local health authority. The staff consists of a medical director, an epidemiologist, a statistician, and two data collection officers. Incidence data are collected using automated cancer registration methods, which rely on electronic submission of cancer cases (coded using ICD and SNOMED) by pathology departments and hospitals, and on electronic submission of population files and death certificates by population offices. The registration process involves record linkage procedures that include analysis of electronic records, ascertainment of prevalent cases, case consolidation, and quality control. The IARC-CHECK program is used for quality control checks and to check quality indicators, such as the percentage of microscopically verified cases, the percentage of death-certificate-only (DCO) cases, and the mortality-to-incidence ratio.

INTERPRETING THE RESULTS

There are three organized cancer screening programmes. Screening was initiated for cervical cancer in 1993, for breast cancer in 2000, and for colorectal cancer in 2007.



USE OF THE DATA

The registry's main task is planning surveillance and preventive programmes. Registry data are also used to evaluate cancer screening programmes and to investigate causes of cancer.

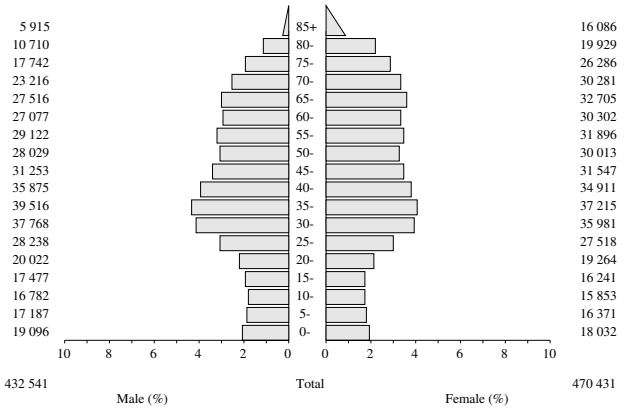
† See note following population pyramid

Italy, Turin

REGISTRATION AREA
The Piedmont Torino City Cancer Registry covers the population of Turin, which is the capital city of both the province of Turin and the Piedmont region of north-western Italy. At the 2005 census, the population was 902 000, with demographics influenced by important migrations; 35% of residents were born in another region of Italy, and 5–8% (mainly young adults) were from other countries, particularly Romania and northern African countries.

CANCER CARE FACILITIES
Turin has 14 public hospitals and 12 private clinics that offer cancer treatment.



REGISTRY STRUCTURE AND METHODS
The registry is affiliated with the Piedmont Reference Centre for Epidemiology and Cancer Prevention (CPO Piemonte). It is staffed by a director, two epidemiologists, and four registrars. The registry's main data sources are hospital records and discharge forms, pathology reports, outpatient and radiotherapy service records, health insurance files (for patients treated outside the region), and death certificates. Almost all registration is active. Follow-up procedures include periodic record linkage with the mortality registry and consultation of municipal records.

INTERPRETING THE RESULTS
In recent years, cancer incidence has stabilized in both sexes (after having increased until the end of the 20th century). Rates of tobacco- and alcohol-related cancers are clearly decreasing in both sexes (with the exception of lung cancer in females). On the other hand, crude rates are increasing as the population ages. Among men, the trend of increasing prostate cancer incidence has had a substantial effect on the incidence trend for cancer overall. There is a slow but constant trend of decreasing mortality in both sexes, with current mortality rates less than half the incidence rates. Three screening programmes are active in the area: mammography and cervical cytology screening since 1992 and colon cancer screening since 1998.

USE OF THE DATA
The registry periodically publishes and updates reports online (http://www.cpo.it/). Registry data are used by the local health authority for planning regional cancer services and are sent to the Italian Cancer Registries database.

Italy, Umbria

REGISTRATION AREA

The Umbrian Population-based Cancer Registry covers central Italy's Umbria region – a small region divided into two provinces. At the 2001 census, the population was 826 000. The population is increasing slowly (due to migration, whereas the natural balance is negative) and is older than the national average.

CANCER CARE FACILITIES

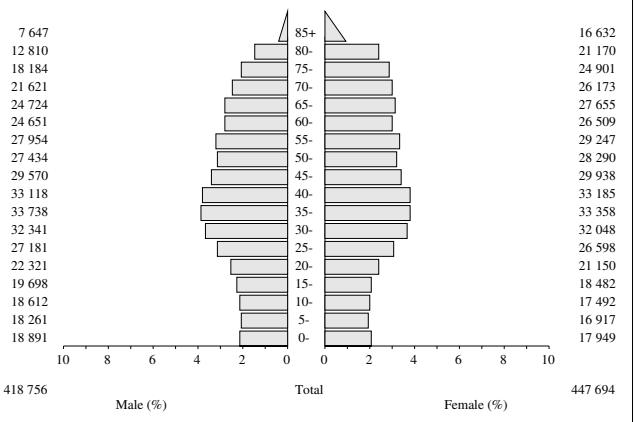
Health care is provided mostly by the region's 18 public hospitals (including two teaching hospitals) and four local health authorities. There are also five private clinics. The main specialized oncology centres are located in the region's two largest cities (Perugia and Terni), at a maximum distance of 55 km from any part of the region.

REGISTRY STRUCTURE AND METHODS

The registry is funded by the regional health authority and is located in the Department of Hygiene of the University of Perugia, which provides personnel and equipment. The main data sources are public and private clinic and hospital records, pathology reports, radiotherapy outpatient records, and death certificates. Other sources are cytology centres for cervical cancer screening, personal case histories, independent studies, reimbursement requests (for patients treated outside the region), and other cancer registries. Trace-back is performed for cases of unspecified behaviour, of unknown primary site, with outpatient records as the only source, or with other missing information (other than death-certificate-only cases). Trace-back procedures include contacting the physician and re-abstracting or re-screening the data.

INTERPRETING THE RESULTS

Organized screening programmes have been in place for breast cancer since 1997, for cervical cancer since 1999, and for colorectal cancer since 2006. Opportunistic screening for prostate cancer and melanoma is also available.



USE OF THE DATA

The registry publishes annual reports on incidence and survival, and a survival study investigating prognostic factors for breast and colorectal cancers is under way. The registry participates in various multicentre studies, such as EUROCARE, the Occupational Cancer Monitoring (OCCAM) project, and IMPACT. Policy-makers use registry data for the planning and evaluation of health services.

Italy, Varese

REGISTRATION AREA

The Lombardy Cancer Registry, Varese Province, covers the province of Varese in the Lombardy region of Italy. The population has increased considerably since the 1960s (from 582 000 in 1961 to 877 000 in 2012), with many people migrating from eastern and southern Italy. These new residents tended to retain the distinctive dietary and cultural habits of their origins. The province's population density is 731.4 residents/km^2. In 2012, the elderly index (the ratio of the population aged more than 64 years to the population aged less than 15 years, multiplied by 100) was 147.9. About 40% of the working population is employed in industry (a considerably lower proportion than in 1971), and less than 1% is employed in agriculture.

CANCER CARE FACILITIES

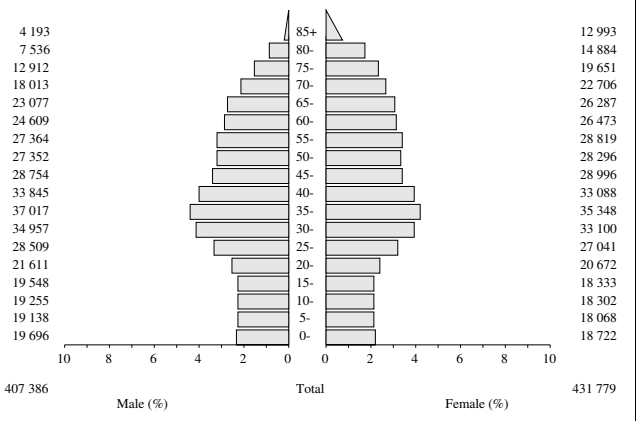
There are 11 general hospitals and five private clinics, providing a total of 3211 hospital beds. The annual hospitalization rate is 134 admissions per 1000 residents.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1974 and is supported by the Lombardy Regional Health Authority. It uses an automated cancer registration system called Open Registry (Contiero et al., 2008). The level of site code concordance between Open Registry and manual registration is 98.4% (Tagliabue et al., 2006). Open Registry has also been adopted by cancer registries in the Lombardy provinces of Sondrio, Brescia, Como, Lecco, Lodi, and Pavia, in collaboration with the provinces' local health authorities.

INTERPRETING THE RESULTS

Screening has been active for breast cancer since 2003 and for colorectal cancer since 2006. The rapid increase in observed breast cancer incidence is due to increased detection through screening. The incidence of colorectal cancer has also increased since the start of the screening programme.



USE OF THE DATA

The registry participates in major epidemiological projects, including the European Prospective Investigation into Cancer and Nutrition (EPIC), ORDET, EUROCARE, RARECARE, and the Automated Childhood Cancer Information System (ACCIS). The registry also provides data to the screening programmes to facilitate quality assurance and follow-up of mammography and colorectal screening.

Italy, Veneto

REGISTRATION AREA

Veneto is the largest region in north-eastern Italy, with a population of more than 4.7 million as of June 2005. The Veneto Tumor Registry covers 49% of this population (about 2.3 million residents), including six of Veneto's seven major urban centres and almost all of the mountainous part of the region. Immigrants account for 6.1% of the covered population. Veneto contains many of the leading economic districts in Italy; in 2005, the region's unemployment rate was 4.2%, compared with the national average of 7.7%.

CANCER CARE FACILITIES

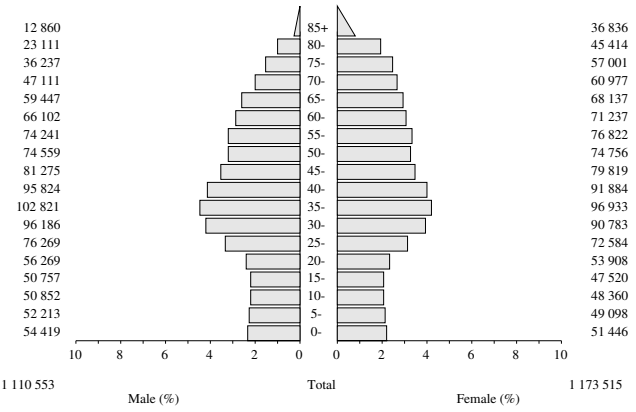
Public health activities, including the management of all hospitals in the region, are handled by 21 local health authorities (LHAs), two autonomous hospitals, and an oncology centre. Most of the LHAs provide comprehensive services for cancer diagnosis, surgery, and chemotherapy. Radiotherapy and certain expensive diagnostic tools are available at the national level. Paediatric patients are treated in the region's two major hospitals.

REGISTRY STRUCTURE AND METHODS

The registry is financially supported by the regional government. The staff consists of a physician (the registry director), three operators, three statisticians, a data manager, two programmers, and a clerk. The registry electronically receives hospital discharge records from all hospitals in the region, death certificates for Veneto residents, and pathology records from the region's 15 pathology laboratories; all information is precoded and submitted annually. Each of the region's LHAs submits a copy of its population files for use as a reference in linking source records, which are evaluated using a case-resolution program.

INTERPRETING THE RESULTS

The proportion of elderly residents in the region has markedly increased. From 1991 to 2005, the elderly index (the ratio of the population aged more than 64 years to the population aged less than 15 years, multiplied by 100) increased from 119 to 146. There are no known unusual environmental or occupational exposures in the region. Cervical, breast, and colorectal screening programmes were started in Veneto during the late 1990s and early 2000s.



USE OF THE DATA

The registry reports incidence, survival, and prevalence data on its website. The registry also collaborates with other Italian registries on research projects and is involved in several international epidemiological studies.

Latvia

REGISTRATION AREA

The Latvian Cancer Registry (LCR) covers the Republic of Latvia, a country in northern Europe with a total area of 64 589 km^2. The population is 2.1 million, and 14.2% of residents are children. Latvia is a member of the European Union and joined the World Trade Organization in 1999. From 2000 to 2008, Latvia had one of the highest gross domestic product (GDP) growth rates in Europe, but the unsustainability of the country's predominantly consumption-driven growth resulted in the collapse of the Latvian GDP in late 2008 and early 2009, with the Latvian economy falling 18% in the first 3 months of 2009.

CANCER CARE FACILITIES

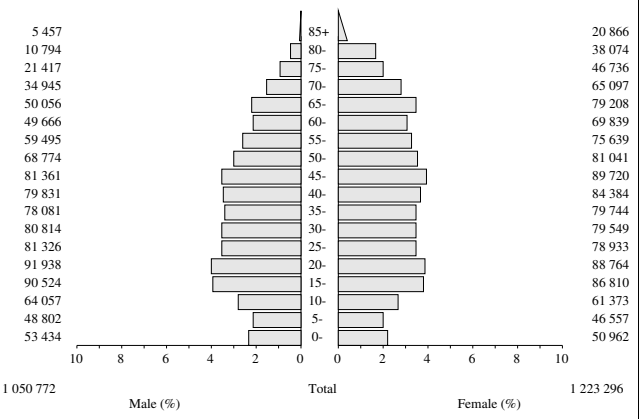
From 1993 to 2009, comprehensive diagnostic and treatment services were provided to the population by the Latvian Oncology Centre, two regional oncology hospitals, and the oncology department of the national clinical hospital (all of which have well-equipped radiology departments). Specialized care for children was provided by the oncology department of the Central Children's Hospital.

REGISTRY STRUCTURE AND METHODS

The LCR was located at the Latvian Oncology Centre from 1993 until 2009. It is now located at the Centre for Disease Prevention and Control (CDPC) of Latvia and is part of the Register of Patients with Particular Diseases. All physicians, hospitals, pathology laboratories, and forensic medicine laboratories must report all new cancer cases. Since 2009, it has been possible to report cases electronically. The LCR regularly receives reports from the national Death Cause Database of cases identified from death certificates.

INTERPRETING THE RESULTS

Although the registration area itself has not changed, its population has. During the registry's reporting period (1990–2011), the Latvian population decreased, both naturally and due to other factors. The availability of medical services has remained nearly the same over time, but the options for cancer diagnosis and treatment have increased. There have been organized screening programmes for cervical and breast cancer in Latvia since 2009.



USE OF THE DATA

Registry data are used to estimate incidence, prevalence, and survival, and are published on the CDPC's website (http://www.spkc.gov.lv/veselibas-aprupes-statistika/). LCR data have also been used for the planning and evaluation of health services.

§Includes 1 case of unknown age

Lithuania

REGISTRATION AREA

The Lithuanian Cancer Registry covers the Republic of Lithuania. At the beginning of 2008, the country's estimated population was 3.4 million, and 84.3% of residents were Lithuanian, 6.2% were Polish, 5.0% were Russian, 1.1% were Belarusian, and 3.4% were of other ethnic minorities. Approximately 66.9% of residents lived in urban areas.

CANCER CARE FACILITIES

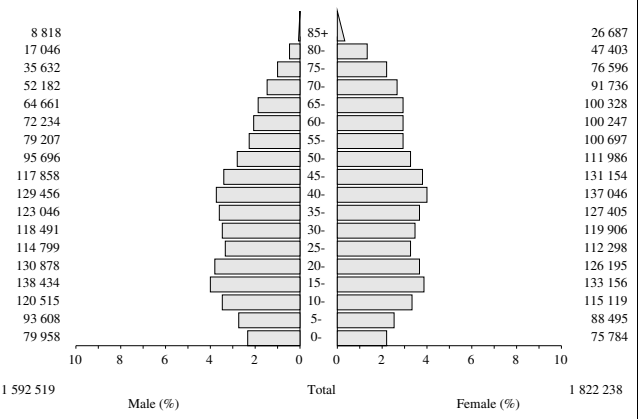
The health care system is highly centralized and was converted to a state insurance-based system in 1997. Patients suspected to have cancer are typically referred by primary and secondary care facilities to specialized cancer hospitals. Specialized modern cancer treatment (surgery, radiotherapy, and chemotherapy) is provided at the Institute of Oncology of Vilnius University, Kaunas University of Medicine Clinics, Klaipėda City Hospital, and Šiauliai City Hospital. Surgery and chemotherapy are also provided at other university hospitals and major treatment centres.

REGISTRY STRUCTURE AND METHODS

The registry operates as a department of the Institute of Oncology of Vilnius University. Its staff includes an epidemiologist, a medical doctor, two medical coders, a programmer, and three registry clerks. The main sources of information are primary, secondary, and tertiary health care institutions. All physicians, hospitals, and other mandated institutions must report all cancer cases that come to their attention. These notifications are supplemented by information from pathology laboratories and death certificates. Certain legislative issues currently pose obstacles to the registry's continued full-scale activity. Although a law about cancer registries was passed by the Lithuanian parliament in 1996, the regulations covering the registry's activities have yet to be approved by the Lithuanian Ministry of Health.

INTERPRETING THE RESULTS

Three screening and early detection programmes were initiated in 2003–2007. Screening began for cervical cancer in June 2004 and for breast cancer (by mammography) in May 2006. Despite expert opposition, a nationwide early detection programme of free prostate-specific antigen (PSA) testing was introduced in 2006.



USE OF THE DATA

The registry has published annual reports on cancer incidence since 1994. The registry is also involved in epidemiological research and has participated in several descriptive and analytical epidemiological studies, including international comparison studies.

Malta

REGISTRATION AREA

The Malta National Cancer Registry (MNCR) covers the population of the Republic of Malta, a small archipelago country in the Mediterranean Sea. At the 2005 census, the population was 410 000. There is no clear distinction between urban and rural residents. Most residents are Roman Catholic, and no distinct ethnic minority groups have been identified.

CANCER CARE FACILITIES

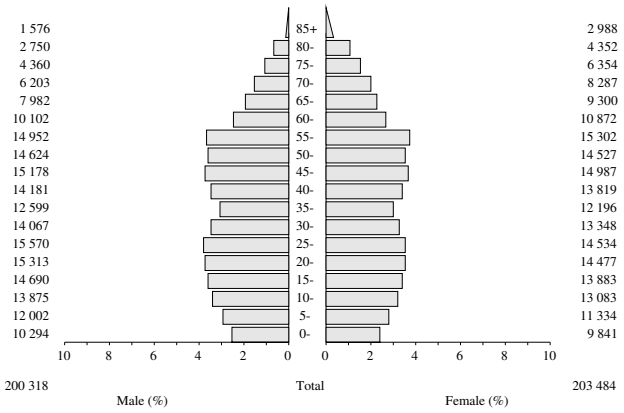
Health care is free for all Malta residents at the point of delivery, funded by federal taxes. Preventive, diagnostic, therapeutic, and rehabilitative services are provided in government hospitals and health centres. There is an acute general teaching hospital in Msida and a smaller general hospital on the island of Gozo. There is one private hospital in Malta, and less than 20% of residents are covered by private health insurance. Cancer surgery is provided in all Maltese hospitals, and radiotherapy and chemotherapy are administered in the oncology department of Sir Paul Boffa Hospital, the country's only cancer centre.

REGISTRY STRUCTURE AND METHODS

The MNCR is funded by the federal government and is part of the Department of Health Information and Research. It is staffed by a full-time medical officer and two registrars. Data are collected mainly through active extraction from pathology laboratories' databases, review of hospital files, and review of the National Mortality Register, which is part of the same federal department. Some passive collection methods are also used. Linkage between the cancer and mortality databases is performed on a regular basis. Almost all cancers diagnosed in Maltese residents are registered, and the number of death-certificate-only (DCO) cases is minimal.

INTERPRETING THE RESULTS

A breast cancer screening programme was started in 2009, and a colorectal screening programme was started in 2012.



USE OF THE DATA

The MNCR has published reports on cancer incidence in EUROCARE and the European Cancer Health Indicator Project (EUROCHIP). The registry is the official national source of information on cancer incidence. It also grants requests for information from both local and international sources.

Malta (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Provided by the Maltese National Statistics Office, based on the 1995 census (for 2003–2005 estimates) and the 2005 census (for 2006–2007 estimates), making allowances for births, deaths, and, migration.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

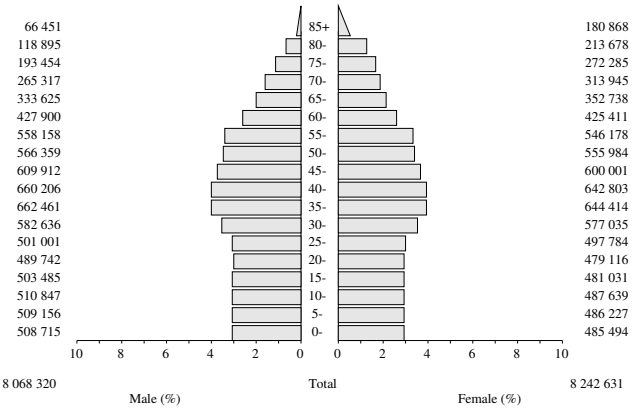
† See note following population pyramid

The Netherlands

REGISTRATION AREA
The Netherlands Cancer Registry (NCR) covers all 16.8 million residents of the Netherlands.

CANCER CARE FACILITIES
Cancer care is provided by all hospitals in the Netherlands (eight university hospitals, one specialized cancer hospital, and more than 80 general hospitals). However, cancer care is increasingly centralized to a limited number of hospitals. Due to mergers, the number of general hospitals has decreased in recent decades. On average, 1000–1500 new cancer cases are diagnosed in each general hospital per year (up to 2500 in the largest hospitals), compared with fewer than 500 new cases per year 25 years ago. Radiotherapy is available in all university hospitals and several general hospitals. The country's comprehensive cancer centres (CCCs) are partnerships between health care professionals and cancer and palliative care institutions, and facilitate access to comprehensive, high-quality cancer care (e.g. by coordinating specialist consultation and support networks and by assembling tumour-specific working groups to develop, implement, and evaluate cancer guidelines). The CCCs are funded by the Ministry of Health, Welfare and Sport.



REGISTRY STRUCTURE AND METHODS
The NCR is maintained by the CCC the Netherlands and the CCC South. The main source of information is the national pathology archive, which sends weekly notifications of all cancer cases. Once a year, the registry is linked with the national hospital discharge register (which provides 5–10% of the NCR's registered cases). Hospital records are reviewed by specially trained registration clerks for additional cases. Death certificates are not available, due to privacy regulations.

INTERPRETING THE RESULTS
The NCR has been population-based since 1989, and its data are more than 95% complete. However, cases diagnosed only at the time of death are missed, as are cases with no associated pathology records.

USE OF THE DATA
The registry publishes national and regional data on annual cancer incidence, prevalence, and survival on its website (http://www.cijfersoverkanker.nl/). The NCR also receives more than 400 requests for more detailed information per year. NCR data are used to evaluate the nationwide breast cancer screening programme and to support numerous projects in collaboration with hospitals and universities, such as evaluations of guidelines and the national cancer control plan.

The Netherlands, Eindhoven

REGISTRATION AREA

The Eindhoven Cancer Registry covers almost all of the province of North Brabant and the northern part of the province of Limburg in the Netherlands. At its inception in 1955, the registry covered an area of about 2500 km^2 with a population of almost 1 million. The covered area was substantially expanded in 1988, and the covered population had increased to 2.3 million by 2005. However, only data from the original area (still covering a population of 1 million; 6.2% of the total population of the Netherlands) is presented in this volume, for the purpose of maintaining the long-term time series across volumes.

CANCER CARE FACILITIES

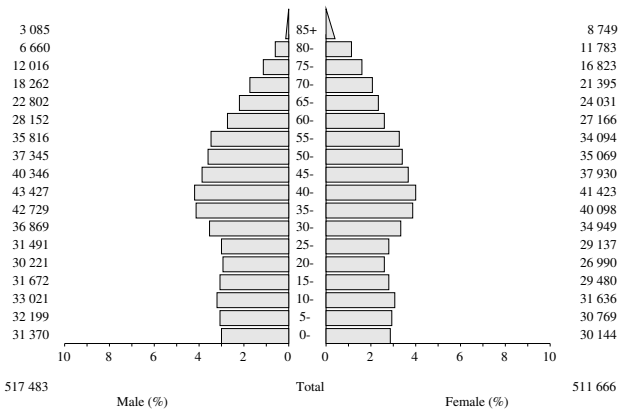
The registration area has six general hospitals, four regional pathology laboratories, and a large radiotherapy institute. The region is characterized by accessible, low-cost medical care. The distance to the nearest hospital is less than 30 km for all residents. Low-volume, complex cancer surgeries are centralized within a limited number of hospitals.

REGISTRY STRUCTURE AND METHODS

The registry started in 1955 as part of an initiative for nationwide cancer registration. Trained registrars extract information on patient and tumour characteristics from medical records and pathology reports submitted to the registry by hospitals and pathology laboratories.

INTERPRETING THE RESULTS

Cervical cancer screening became available in the 1970s, but its use declined during the 1980s, until an organized programme was established in 1988. In 1996, the programme was adjusted to target women aged 30–60 years. An organized biennial mammography screening programme was gradually implemented among women aged 50–70 years during 1992–1996, and was extended to women aged up to 75 years in 1998.



USE OF THE DATA

Every 5 years, the registry publishes an overview of trends in incidence, stage, and survival of patients registered since 1958. Since 1978, survival has also been studied within the framework of EUROCARE. In recent years, registry data have been used extensively for studies on quality of care, quality of life, and cancer in the elderly; for that purpose, serious comorbidities at diagnosis have been registered since 1993. The registry's research department (approximately 25 employees) has a strong regional, national, and European orientation.

Norway

REGISTRATION AREA

The Cancer Registry of Norway (CRN) covers the entire population of Norway, which has a total area of 324 000 km^2. As of 1 January 2011, the total population was 4.9 million. Most residents are ethnic Norwegian, 0.5% are Sami, and 11.6% are foreign-born.

CANCER CARE FACILITIES

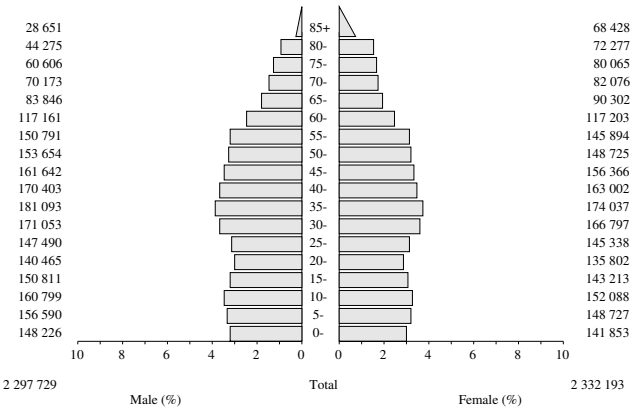
There are four regional health authorities in Norway. Surgical cancer treatment is available at general hospitals and oncology centres, and radiotherapy is provided by 10 separate hospital departments. In 2010, there were approximately 3.3 hospital beds and 4.3 physicians per 1000 residents. Treatment costs are covered by the national health system.

REGISTRY STRUCTURE AND METHODS

All hospitals, laboratories, and general practitioners in Norway are required to report new cases of cancer. The Ministry of Health and Care Services is financially responsible for the CRN. The registry has about 130 employees organized in four departments and three screening units. The staff consists of physicians, researchers, statisticians, research assistants, information staff members, information and communication technology staff members, and administrative personnel. The registry receives about 120 000 notifications per year (an average of 3.2 notifications per case), which are coded and manually registered by the CRN staff. In recent years, additional information about all patients treated for cancer has been received from the Norwegian Patient Register. These data are a key source for identifying otherwise unreported cases. The estimated completeness of all cases combined is 98.8%, and about 90% of the cases are histologically verified (Larsen et al., 2009).

INTERPRETING THE RESULTS

Breast cancer screening has been offered to Norwegian women since 1995, and cervical cancer screening since 1990. The continuing increase in prostate cancer incidence since 1990 is largely due to the increasing frequency of prostate-specific antigen (PSA) testing.



USE OF THE DATA

Updated cancer incidence, mortality, survival, and prevalence data are published annually in the report *Cancer in Norway*. The CRN also receives about 300 requests for cancer data per year for inclusion in research projects. The registry provides up-to-date data to the relevant authorities for use in cancer prevention, cancer care planning, and evaluation of health services.

† See note following population pyramid

Poland, Cracow

REGISTRATION AREA

The Cracow Cancer Registry covers Lesser Poland Province in southern Poland. The province has an area of 15 183 km^2 and had a population of 3.3 million in 2005. The city of Cracow has an area of 327 km^2 and had a population of 758 000 (46.8% males and 53.2% females) in 2005. The population is relatively ethnically homogeneous, and the prevailing religion is Roman Catholicism. Cracow is one of the largest industrial (with metallurgical, electromechanical, chemical, and food industries), cultural, and educational centres of Poland.

CANCER CARE FACILITIES

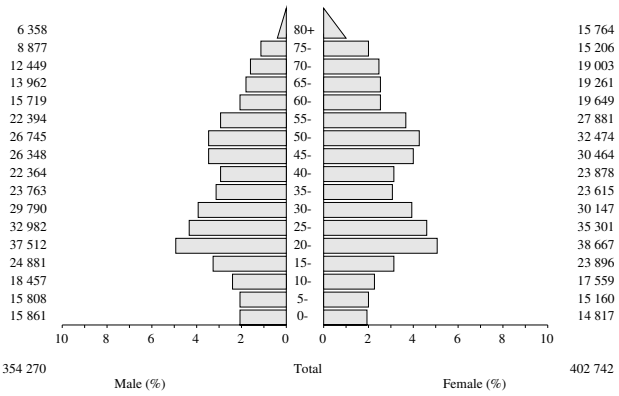
Cancer diagnosis and treatment services are provided in Cracow by the Maria Skłlodowska-Curie Memorial Institute of Oncology, 22 clinics of the Jagiellonian University Medical College, and 10 hospitals. Two hospitals in the registration area provide radiotherapy.

REGISTRY STRUCTURE AND METHODS

The registry is part of the Epidemiology Unit of the Maria Skłlodowska-Curie Memorial Institute of Oncology, and is supported by the Polish Ministry of Health. The registry staff consists of an epidemiologist, four registrars, a statistician, and a computer programmer. Notification of cancer cases and suspected malignant neoplasms has been mandatory in Poland since 1952. All hospitals, outpatient clinics, and individual physicians must report all cancer cases using special cards submitted to the registry. The registry conducts active case finding by checking hospital records and pathology records. Patient follow-up (through checking medical records) is carried out by the registry once a year. If no data about a cancer patient are available, information is collected via the Address Office in Cracow. Quality control is performed using the IARC-CHECK program and programs developed by the registry.

INTERPRETING THE RESULTS

Opportunistic screening for colorectal, prostate, cervical, and breast cancers has been available in Cracow since 2001. In 2006, organized screening programmes for breast and cervical cancer were implemented throughout Poland. Changes in smoking habits in recent decades are the likely explanation for diverging trends in lung cancer rates in males and females.



USE OF THE DATA

The registry publishes an annual report on cancer incidence and mortality, conducts cancer survival analyses, and participates in international, multicentre studies on survival and patient care, such as EUROCARE, the European Network for Indicators on Cancer (EUNICE) project, and CONCORD.

Poland, Kielce

REGISTRATION AREA

The Holycross Cancer Registry covers Poland's Holycross Province, which has an area of 11 691 km^2. The Holycross Mountains are situated in the north of the province, and there is a fertile agricultural region in the south. The Vistula River forms the province's south-eastern border. The population is 1.3 million (49% males and 51% females), about 3% of the total Polish population. About 45% of residents live in urban areas and 55% in rural areas.

CANCER CARE FACILITIES

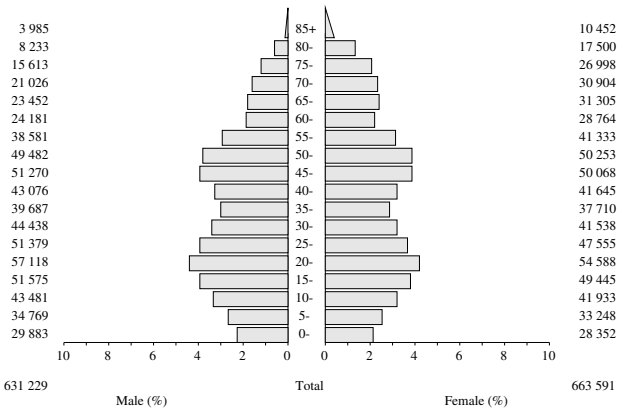
The Holycross Cancer Center in Kielce (the provincial capital) provides cancer treatment (surgical oncology, chemotherapy, radiotherapy, brachytherapy, haematology, endocrinology, and palliative care) and diagnostics (radiology, nuclear medicine, and microbiology).

REGISTRY STRUCTURE AND METHODS

The registry is part of the Holycross Cancer Center. It is staffed by a physician oncologist, a full-time biologist, two part-time computer scientists, and three full-time registrars. All physicians and medical centres must report all cancer cases using a special notification form, which includes basic demographic and diagnostic information. Although reporting is mandatory, it is often neglected, so all received records are completed by the registry staff and checked against data from the Statistical Office in Kielce, local civic departments, and hospitals.

INTERPRETING THE RESULTS

Three organized population screening programmes were initiated in 2000: for cervical cancer (among women aged 25–59 years), breast cancer (among women aged 50–69 years), and colorectal cancer (among men aged 55–64 years).



USE OF THE DATA

The registry publishes an annual report for the local government on cancer incidence, mortality, and survival. The 2015 report also includes data on incidence and predilection. Registry reports are presented at national and international conferences. The registry cooperates with the European Network of Cancer Registries (ENCR), IARC, and IACR, as well as various members of these organizations. The registry participates in international projects, such as *Cancer Incidence in Five Continents*, EUROCARE, Europe against Cancer: Optimisation of the Use of Registries for Scientific Excellence in Research (EUROCOURSE), *International Incidence of Childhood Cancer*, the European Cancer Health Indicator Project (EUROCHIP), RARECARE, and CONCORD.

Poland, Lower Silesia

REGISTRATION AREA

The Lower Silesian Cancer Registry covers Lower Silesia Province in south-western Poland. The province has an area of 19 947 km^2 and is bordered by Germany to the west, the Czech Republic to the south, Opole Province to the east, and Greater Poland Province to the north. There are four cities with populations of more than 100 000: Wroclaw (the provincial capital), Walbrzych, Legnica, and Jelenia Gora. Lower Silesia is intensely urbanized and has many industries, which employ about 15% of all residents. The province is relatively low-lying and partly submountainous; its southern border is formed by the Karkonosze Mountains. In 2010, Lower Silesia had a population of 2.9 million (48% males and 52% females); 70% of whom were living in cities and 30% in rural areas. There are no data on ethnic groups in the province. The large majority of residents are Roman Catholic.

CANCER CARE FACILITIES

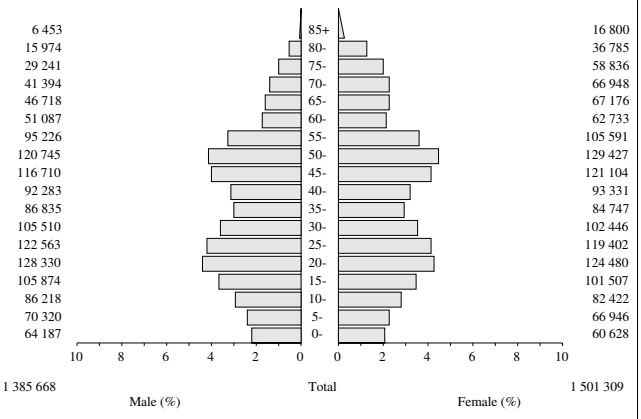
The Lower Silesian Oncology Centre in Wroclaw is a referral hospital with 330 beds. It provides various services for cancer treatment (including surgical oncology, chemotherapy, radiotherapy, brachytherapy, and outpatient palliative care), with more than 100 oncologists on staff. Radiotherapy services are also provided by Euromedic Onkoterapia in Walbrzych.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1962, when mandatory reporting of all cancer cases was introduced in Poland. The registry is part of the Cancer Epidemiology Department of the Lower Silesian Oncology Centre in Wroclaw. Six medical administrative staff members ensure data quality and completeness, and the registry also employs a physician, a mathematician, and a computer programmer. Patient data (including name, date of birth, and ICD site code) have been registered electronically since 1984. Many checks are used to eliminate duplicate registrations, identify multiple primaries, and correct any errors in the coding of topography and morphology.

INTERPRETING THE RESULTS

There are organized population screening programmes for breast and cervical cancers, and opportunistic screening programmes for prostate and colorectal cancers.



USE OF THE DATA

After a 2-year period for verification, the information collected is analysed to provide estimates of cancer incidence by site, age-standardized to the world standard population. The registry also analyses the distribution of new cases by age and geographical location, as well as time trends. Mapping is used extensively to visualize the data.

Poland, Podkarpackie

REGISTRATION AREA

The Podkarpackie Cancer Registry (PCR) covers the population of Podkarpackie Province in south-eastern Poland. The province is divided into 25 counties. At the end of 2005, the population was 2.1 million, with about 40% of residents living in urban areas.

CANCER CARE FACILITIES

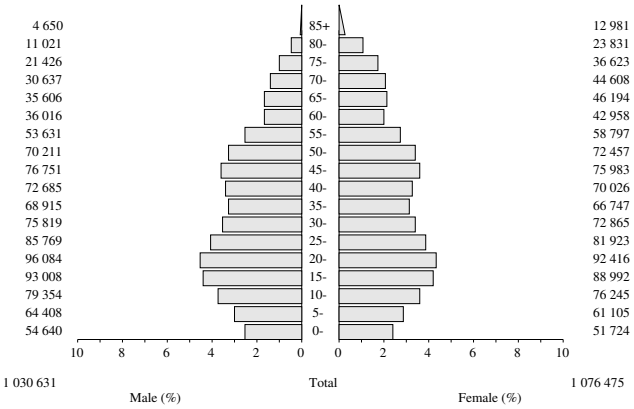
Outpatient and inpatient health care is provided by public and private health care units and practitioners. Cancer patients receive consultations and specialist care in 21 cancer centres and four hospitals with special oncology wards (three with inpatient oncology wards and the fourth with an outpatient chemotherapy ward). The hospitals provide chemotherapy, radiotherapy, and surgical interventions.

REGISTRY STRUCTURE AND METHODS

The PCR operates within the Podkarpackie Centre of Public Health in Rzeszów. The registry is staffed by three full-time registrars, a part-time oncologist, and a part-time information technology officer. Health care units and private and public practitioners provide information on confirmed and suspected cancer cases in Podkarpackie residents, including cases diagnosed outside the province. Cancer cases diagnosed on autopsy are also reported to the registry, and the PCR includes data on all cancer deaths in the province, whether previously registered or not. The comparison of hospital data from general hospitals in the province with cancer databases also enables the generation of lists containing information about inpatients treated for cases that were not reported to the registry.

INTERPRETING THE RESULTS

As part of Poland's National Cancer Control Program, screening programmes for breast, cervical, and colorectal cancers are in place within Podkarpackie. However, it is not possible to determine the rates of participation in these screening programmes, due to limited transmission of data from health care organizations.



USE OF THE DATA

The registry publishes annual reports that summarize current cancer trends and compare data with those from previous years. The PCR's cancer bulletins are available from the registry's website (http://rejonk.rzeszow.uw.gov.pl).

Portugal, Azores

REGISTRATION AREA

The Azores Cancer Registry covers Portugal's Autonomous Region of the Azores, which is an archipelago composed of nine volcanic islands in the North Atlantic Ocean. The islands are divided into three groups: the Western Group (Flores and Corvo), the Central Group (Terceira, Faial, Pico, São Jorge, and Graciosa), and the Eastern Group (São Miguel and Santa Maria). At the 2011 census, the region's total population was 246 000 (121 000 males and 125 000 females). The region covers an area of 2346 km^2 and is divided into 19 municipalities.

CANCER CARE FACILITIES

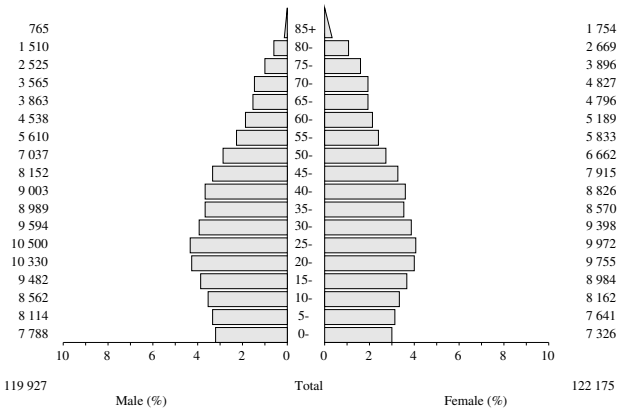
There are three hospitals in the region: on the islands of São Miguel, Terceira, and Faial. There are also 16 health centres and one oncology centre, which is responsible for both the registry and the organized cancer screening programmes.

REGISTRY STRUCTURE AND METHODS

Data collection is both passive and active. The registry's main information sources are the three regional public hospitals, several private pathology laboratories (some on the archipelago and others in mainland Portugal), and the country's other three regional population-based cancer registries. The Azores Cancer Registry receives information electronically from the pathology and haematology-oncology departments of the regional public hospitals. The private laboratories routinely submit their information in the form of pathology reports, and the other regional cancer registries forward any information about Azorean cancer patients diagnosed or treated outside of the Azores. Death certificates specifically citing cancer are also received by the registry. On the basis of the information gathered from hospital information systems and death certificates, registry staff members actively look for patients' clinical data in hospital and health centre records.

INTERPRETING THE RESULTS

A screening programme was launched for breast cancer in November 2008 and for cervical cancer in February 2010. A screening programme for colorectal cancer is also being planned.



USE OF THE DATA

Registry data have been included in projects such as EUROCARE, the European Cancer Incidence and Mortality (EUROCIM) database, *International Incidence of Childhood Cancer*, and CONCORD. The data are also available from the European Cancer Observatory website.

Russian Federation, Saint Petersburg

REGISTRATION AREA

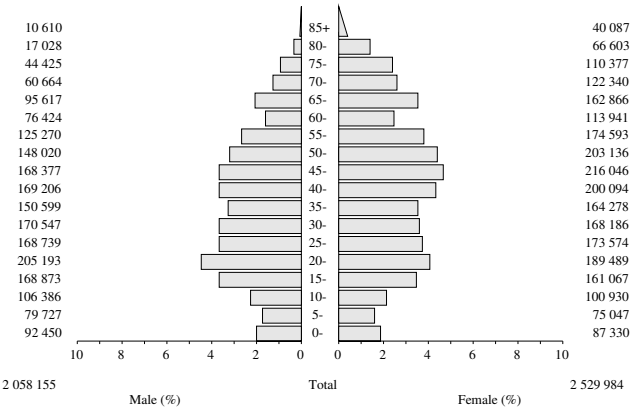
The St. Petersburg Population-based Cancer Registry covers Saint Petersburg, which is the second largest city in the Russian Federation and one of its main industrial, scientific, and cultural centres. Saint Petersburg was founded in May 1703. Its name was changed to Petrograd in 1914, to Leningrad in 1924, and back to Saint Petersburg in 1991. It was the capital of Russia from 1712 to 1728 and from 1732 to 1918. The city's total area is 570 km^2. The main occupations are in heavy industry, and particularly in heavy engineering (such as energy engineering, machine-tool construction, and shipbuilding). In 2010, the population was 4.8 million and the all-cause mortality rate was 14.2 deaths per 1000 residents. In 2009, the average life expectancy was 71.2 years.

CANCER CARE FACILITIES

There are three medical institutes and two advanced physician training institutes, as well as many clinics and hospitals. Some patients come from other parts of the country. Cancer treatment is provided primarily by the St. Petersburg City Oncology Dispensary at the Professor N.N. Petrov Research Institute of Oncology, and in several oncology departments in large general hospitals. The total number of hospital beds for cancer patients is 1416, including 428 for radiology and 75 for paediatric patients. About 37% of cancer patients are treated in general hospitals and clinics.

REGISTRY STRUCTURE AND METHODS

The general process of registration is the same as that used in other Commonwealth of Independent States (CIS) countries. Any physician who diagnoses a patient with cancer must send a notification card to the oncology dispensary or the cancer registry of the patient's region of residence. On the basis of this card (and other documents), a control card is compiled and its information entered into the electronic database. The oncology dispensary data are checked regularly against those of the statistics department (which is responsible for registering cancer deaths).



USE OF THE DATA

Information about all cancer patients and cancer deaths is compiled in special tables and sent to the Ministry of Health of the Russian Federation annually. Registry data are also used for epidemiological research carried out by the Professor N.N. Petrov Research Institute of Oncology, including a study of geographical cancer incidence in different areas of the CIS.

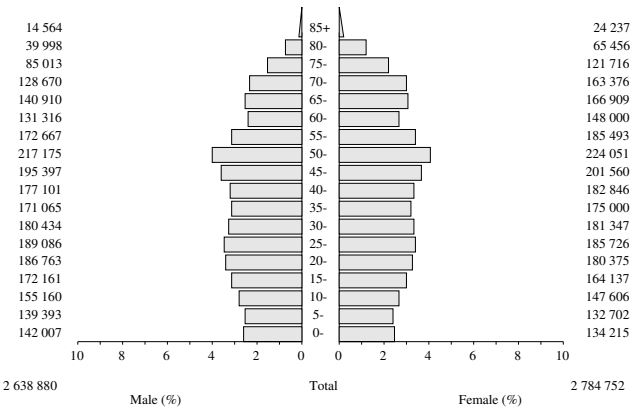
Serbia, Central

REGISTRATION AREA
The Central Serbia Cancer Registry covers 18 districts within the Republic of Serbia, which are further divided into 115 municipalities. The registry covers an area of 55 968 km^2, the population of which was 5.5 million at the 2002 census. More than half of the area's residents (56%) live in urban areas.

CANCER CARE FACILITIES
The registry receives information about new cancer cases from oncology institutes, oncology dispensaries, clinics, hospitals, outpatient facilities, pathology laboratories, death certificates, and health insurance records, as well as through targeted searches.



REGISTRY STRUCTURE AND METHODS
The registry has been reorganized, resulting in several changes, including decentralization (the main database for Central Serbia is located within the Institute of Public Health of Serbia), the initiation of active data collection, new sources of information, additional training of medical personnel, additional informatics support, and the implementation of a feedback system. The registry database includes the following data items: personal characteristics, possible occurrence of multiple primary tumours, incidence date, method used for diagnosis, tumour characteristics (primary and secondary anatomical localization, histology type, and stage), and disease outcome. The registry uses CanReg4 software and uses IARC and European Network of Cancer Registries (ENCR) methodology for data collection, entry, storage, processing, and analysis.

INTERPRETING THE RESULTS
Serbia began a gradual introduction of organized screening for cervical, colorectal, and breast cancers in January 2013 (which is after the registration period covered in this volume).

USE OF THE DATA
Unpublished data from the Statistical Office of the Republic of Serbia were used for the analysis of deaths due to malignant tumours in Central Serbia.

CONTRIBUTORS
Dragan Miljus
Snezana Zivkovic

Serbia, Central (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION
Based on 2010 estimates provided by the Statistical Office of the Republic of Serbia, making allowances for births and deaths (but not migration).

NOTES ON THE DATA
*Reported underregistration due to legislative difficulties.

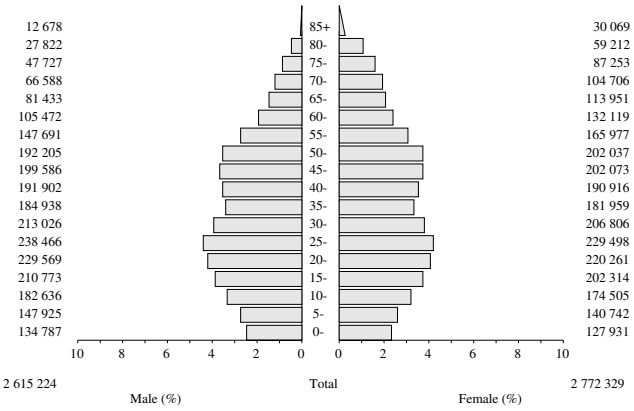
Slovakia

REGISTRATION AREA
The Slovakia National Cancer Registry covers the Slovak Republic, which has a total area of 49 035 km^2 and is divided into eight counties and 78 districts. In 2005, the population was 5.4 million (2.6 million males and 2.8 million females).

CANCER CARE FACILITIES
Basic cancer care is provided by outpatient oncology clinics, which are also responsible for active patient follow-up. There are 95 hospitals. Most patients are treated in county hospitals, including seven university hospitals with oncology and radiology departments. Highly specialized cancer care is provided at the Slovak National Cancer Institute, the St. Elisabeth Cancer Institute, and the East Slovakia Cancer Institute. Treatment is free of charge. The Slovak League Against Cancer provides health education.



REGISTRY STRUCTURE AND METHODS
Notification of cancer cases and deaths has been mandatory since 1952. The registry was established in 1976, and data are available on new cases since 1968. Data are actively collected from notifications and death certificates, and from autopsy, histology, cytology, and hospital discharge reports. Each newly reported case is checked against the registry database, and the database is annually reconciled with the Slovak Ministry of Health's database of all hospitalized persons. Missing information is requested from providers. The registry originally used the ICD-O-1, ICD-9, and TNM classification systems, then upgraded to ICD-O-2 and ICD-10 in 1994 and to ICD-O-3 in 2007. The registry is staffed by two full-time physicians specializing in epidemiology, five part-time physicians specializing in oncology and pathology, a statistician, and six registrars.

INTERPRETING THE RESULTS
There are no organized population-based screening programmes in Slovakia.

USE OF THE DATA
Incidence data for the whole country and by administrative region have been published annually since 1968. Policy-makers use registry data for priority planning and orientation of primary and secondary prevention initiatives. The registry is actively engaged in graduate and postgraduate medical education and in epidemiological studies, including several international projects.

Slovenia

REGISTRATION AREA

The Cancer Registry of the Republic of Slovenia (CRS) covers Slovenia, which had a population of 2 million in 2005 (83.1% Slovenian). Residents of other nationalities are mainly from neighbouring countries. The prevailing religion is Roman Catholicism, and 15.5% of residents are aged 65 years or more.

CANCER CARE FACILITIES

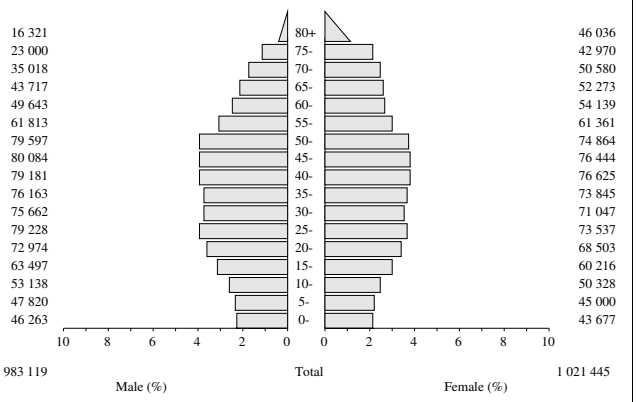
Cancer treatment is completely covered by mandatory public health insurance. Primary care is provided by health care centres and general practitioners within the public network. Secondary care is provided by 11 general hospitals and two tertiary clinical centres, in Ljubljana and Maribor. Common cancers are typically treated in general hospitals, and rare cancers are referred to the Institute of Oncology Ljubljana, which is the only national comprehensive cancer centre and the only facility that administers radiotherapy. It is also involved in research and education. In 2010, the National Cancer Control Programme of Slovenia was initiated, with the goal of improving all aspects of cancer prevention and care in Slovenia.

REGISTRY STRUCTURE AND METHODS

The CRS was founded in 1950 at the Institute of Oncology Ljubljana. Notification of cancer is mandated by law. The registry's main data sources are notifications from all hospitals and diagnostic centres. Death certificates and autopsy reports are additional sources. Trained registrars code the data under the supervision of a physician. Cases are identified by personal identification number, which also enables accurate follow-up of vital status via daily online linkage to the Slovenian Central Population Register.

INTERPRETING THE RESULTS

There have been no major changes in the registry's data processing procedures in recent years. A nationwide organized cervical cancer screening programme was initiated in 2003 and is already contributing to decreasing cervical cancer incidence rates. The effects of the breast and colorectal cancer screening programmes introduced in 2008 are not yet detectable. Prostate-specific antigen (PSA) testing is common, which is contributing to the high rates of prostate cancer.



USE OF THE DATA

Since 2010, the registry has published annual reports and data analyses on the SLORA online portal (http://www.slora.si/), which can be accessed by the general public. CRS data are also used for planning and evaluation of the National Cancer Control Programme and in national and international research.

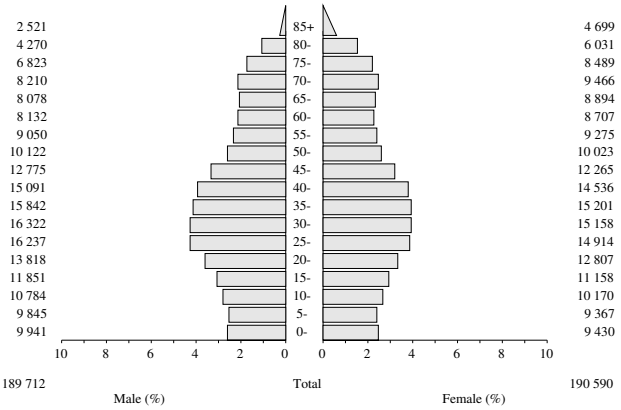
Spain, Albacete

REGISTRATION AREA
The Albacete Cancer Registry covers the province of Albacete in the south-east of Castilla-La Mancha, an autonomous community in central Spain. The province has a population density of 25.6 residents/km^2, with 38% of the population living in towns with fewer than 15 000 residents and 62% living in urban areas. About 7% of working residents work in agriculture, 18% in industry, 12% in construction, and 63% in the service sector.

CANCER CARE FACILITIES
Health care is provided by the Regional Health Care Services of Castilla-La Mancha (SESCAM), 34 public primary care centres, three public hospitals (with 901 beds), and three private hospitals (with 128 beds). Few resident cases are diagnosed or treated outside the province.



REGISTRY STRUCTURE AND METHODS
The registry was created by the regional health department in 1990 and is part of the regional epidemiology service. Data collection is active, based on lists provided by information sources and through consultation of relevant records. Some cases are voluntarily reported by primary care physicians. An automated system checks for duplicate registrations. Cases are coded according to ICD-O topography and morphology. The registry uses the IARC/IACR rules for multiple primary tumours and uses the IARC-CHECK program to detect errors and discrepancies in the data.

INTERPRETING THE RESULTS
There is an organized screening programme for breast cancer (among women aged 50–69 years) and an opportunistic screening programme for cervical cancer (among women of reproductive age). Prostate-specific antigen (PSA) testing is commonly conducted in men aged more than 50 years.

USE OF THE DATA
The registry publishes an annual report on cancer incidence by location, sex, and age. The registry also participates in analytical epidemiological research.

Spain, Asturias

REGISTRATION AREA

The Asturias Cancer Registry covers the Principality of Asturias, an autonomous community of Spain located on the northern coast of the Iberian Peninsula. In 2005, the population was 1.1 million, with 21.9% of residents aged 65 years or older and 80% living in urban areas. The population density was 101.5 residents/km^2.

CANCER CARE FACILITIES

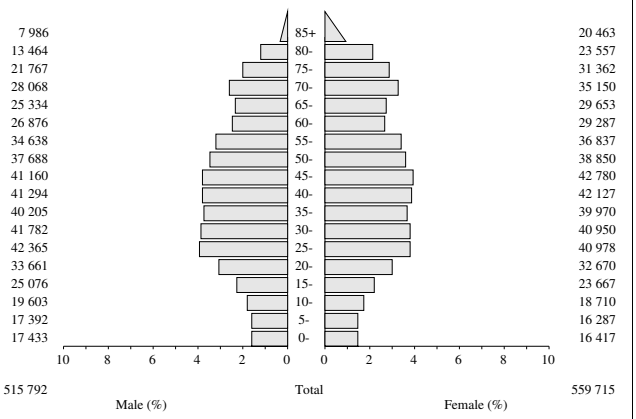
General health care in Asturias is provided mostly by public services, through a well-developed network of eight district hospitals, 220 local primary health care centres, and a central hospital in the capital (Oviedo), which has a comprehensive oncology centre that provides cancer surgery, radiotherapy, and chemotherapy services. Patients suspected to have cancer are diagnosed and treated in the eight district hospitals and referred to the central hospital when necessary. These public facilities are supplemented by one private hospital, which offers some cancer treatments. Very few cancer patients need additional treatment outside Asturias.

REGISTRY STRUCTURE AND METHODS

The registry was started in 1978 and became population-based in 1982. It is publicly funded by the Asturian regional government and staffed by one part-time epidemiologist and two full-time registrars. The registry uses active case finding from various sources, including public and private hospitals, pathology and haematology laboratories, and death certificates. There is also a hospital-based registry in the central hospital, which provides electronic files to the Asturias Cancer Registry. Cancer is not a reportable disease in Asturias.

INTERPRETING THE RESULTS

An organized population-based breast cancer screening programme was implemented in 2000 among women aged 50–69 years. Participation in the first round of screening reached 80%.



USE OF THE DATA

The registry regularly publishes reports on cancer incidence. Registry data have been used in etiological research such as the European Prospective Investigation into Cancer and Nutrition (EPIC), for evaluation of the breast cancer screening programme, and for planning radiotherapy facilities and other cancer services.

Spain, Basque Country

REGISTRATION AREA

The Basque Country Cancer Registry (BCCR) covers all three provinces of the autonomous community of the Basque Country: Álava, Biscay, and Gipuzkoa. In 2006, the total population was 2.1 million. About 61.4% of residents work in the services sector and 28.6% in industry. Life expectancy at birth is 77.3 years for males and 84.8 years for females.

CANCER CARE FACILITIES

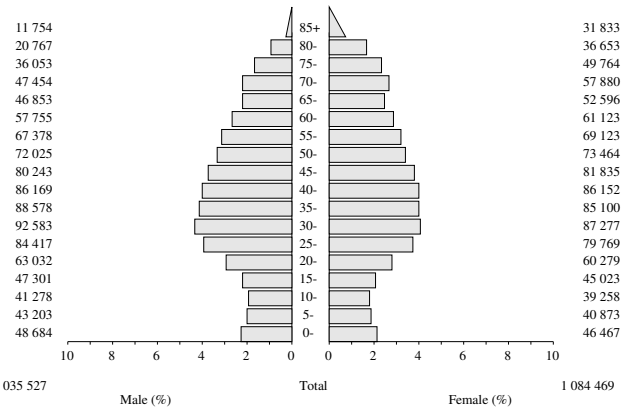
General health care is provided to 95% of the population by the Osakidetza (the public health care system of the Basque Country). There are 40 hospitals (public and private). Most cancer patients seen within the network of primary health care centres are referred to general hospitals with oncology facilities.

REGISTRY STRUCTURE AND METHODS

The BCCR was created in 1986 by the region's health department, which coordinates three provincial teams. Hospital cancer registries are the registry's main source of information. Notification is voluntary, and a system of active data collection from other sources has been established. The BCCR also receives information about resident cases from registries outside the area. Data from incident cases are complemented by death certificates mentioning cancer. The registry uses modified IARC/IACR rules for multiple primary tumours.

INTERPRETING THE RESULTS

An organized population-based screening programme for breast cancer was established among women aged 50–64 years in 1995, and was extended to women aged up to 69 years in 2006. There are no population-based cervical or prostate cancer screening programmes, but opportunistic screening is available.



USE OF THE DATA

The registry annually reports incidence, trends, and survival data for main sites. Registry data are used for the planning and evaluation of health services, the cancer strategy for Basque Country, and screening programmes. The registry collaborates on several national and international projects, such as EUROCARE, EUROPREVAL, the Automated Childhood Cancer Information System (ACCIS), and the European Prospective Investigation into Cancer and Nutrition (EPIC).

Spain, Canary Islands

REGISTRATION AREA

The Canary Islands are an autonomous community of Spain located 100 km east of the African coast and 1500 km from mainland Spain. The Canary Islands Cancer Registry covers the region's two major islands: Gran Canaria and Tenerife. In 2005, the covered population was 1.6 million (almost 100% Caucasian). The main economic activities are agriculture (7%), industry (3.4%), and services – mainly tourism (77.9%).

CANCER CARE FACILITIES

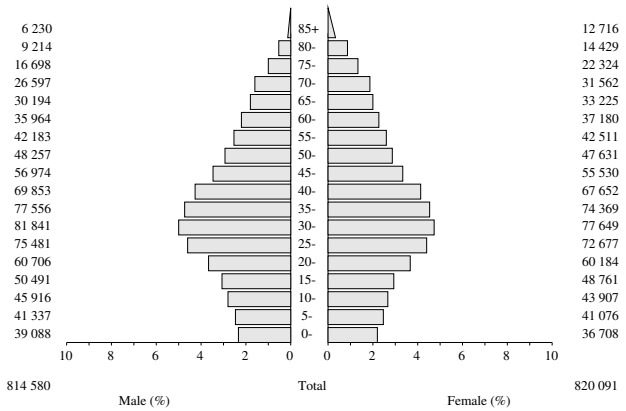
There is a network of primary health care centres and four reference hospitals, with oncology, radiotherapy, and haematology services. There is also a growing network of private hospitals.

REGISTRY STRUCTURE AND METHODS

The registry is part of the Epidemiology and Prevention Service of the Canary Islands General Directorate of Public Health. The registry is divided into two sections (one for each of the islands covered) and is staffed by two preventive medicine and public health specialists, a physician, two nurses, and a clerk. The registry was created by law in 1993. Registry staff members actively collect data from public and private hospitals and search for cases in pathology, radiotherapy, haematology, and hospital discharge databases. Death certificates with cancer listed as the primary cause of death are also used for case finding. Since 2006, the registry has had direct access to the electronic records systems of the four major hospitals. Although some cancer patients go to mainland Spain to receive treatment, most diagnoses are made on the islands, and death certificates allow the registry to capture previously missed cases.

INTERPRETING THE RESULTS

There has been an organized screening programme for breast cancer (among women aged 50–69 years) since 1999 and for colorectal cancer (among residents aged 50–69 years) since 2009. Opportunistic screening for cervical and prostate cancers is common within the population.



USE OF THE DATA

The registry periodically publishes incidence data on the Canary Islands government website (http://www2.gobiernodecanarias.org). The data are used by hospitals and the government for health services planning. The registry has also collaborated with other Spanish registries and the Spanish National Centre of Epidemiology, and is a member of the recently created Spanish network of cancer registries (REDECAN).

† See note following population pyramid

Spain, Ciudad Real

REGISTRATION AREA

The population-based Ciudad Real Cancer Registry (RCCR) covers the province of Ciudad Real in the autonomous community of Castilla-La Mancha in Spain. In 2004, the population was 489 000, with immigrants accounting for about 3.5% of the total, and 9.7% of the population living in rural areas with fewer than 2000 residents. The province has 102 municipalities, a total area of 19 813 km^2, and a population density of 24.88 residents/km^2.

CANCER CARE FACILITIES

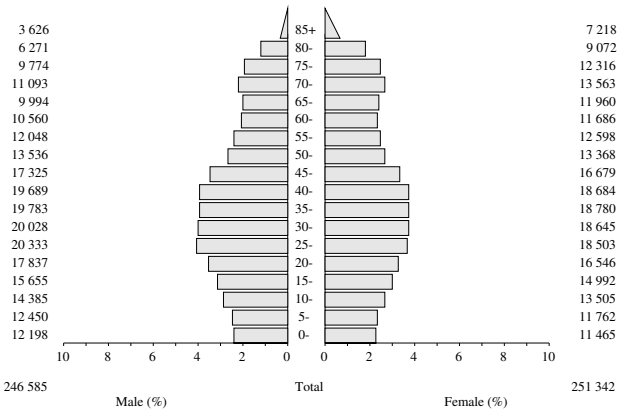
Almost all residents are covered by the Regional Health Care Services of Castilla-La Mancha (SESCAM). Within the province there are five SESCAM-run hospitals (providing 92.7% of the area's hospital beds) and one private hospital. Two of the SESCAM-run hospitals have oncology services that provide chemotherapy and surgical procedures. Radiotherapy is provided in one SESCAM-run hospital and one outpatient centre. There are 53 SESCAM-run primary health care centres in the province.

REGISTRY STRUCTURE AND METHODS

The RCCR was created in 2004, within the Epidemiology Service of the Health Department of the Autonomous Community of Castilla-La Mancha. The registry staff members work at the provincial capital branch of the Epidemiology Service. The registry covers all malignant tumours diagnosed from 1 January 2004 in patients living in the province of Ciudad Real. Data are actively collected by RCCR personnel from primary sources and from complementary files and clinical records.

INTERPRETING THE RESULTS

SESCAM is responsible for a full range of diagnostic and treatment facilities, so it is unlikely that any cases will be missed. A screening programme for breast cancer began in 1993. Prostate-specific antigen (PSA) testing is common, although its exact prevalence is unknown.



USE OF THE DATA

In addition to being included in reports on cancer incidence, registry data are used to analyse trends, make geographical comparisons, and measure the effect of the breast cancer screening programme.

Spain, Cuenca

REGISTRATION AREA

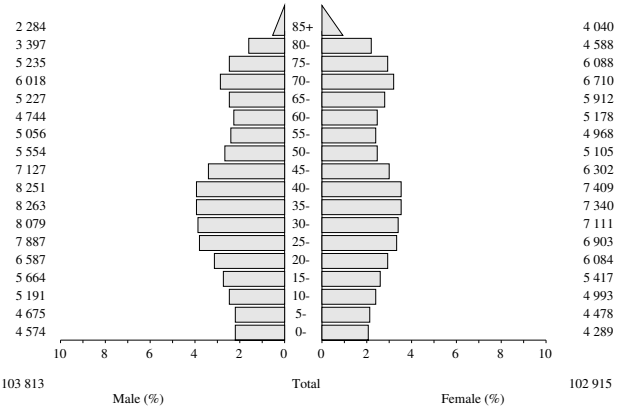
The population-based Cuenca Cancer Registry (RCCU) covers the province of Cuenca in the autonomous community of Castilla-La Mancha in Spain. In 2005, the population was 207 000.

CANCER CARE FACILITIES

The province has one hospital and 37 primary health care centres.

REGISTRY STRUCTURE AND METHODS

The RCCU was created in 1993 and covers all malignant tumours diagnosed from 1 January 1993 in patients residing in Cuenca at the time of diagnosis (or at the time of death if the only source of information is a death certificate). Active data collection is performed by registry personnel through review of clinical histories. The registry receives automated discharge files and electronic pathology reports from the public hospital. It also receives information from general practitioners and attending physicians in hospitals, as well as from death certificates. Cases are coded using the ICD-O-3 classification system, and the registry uses the IARC/IACR rules for multiple primary tumours. Access to patient data is restricted to registry personnel, and systems are in place to ensure confidentiality.



INTERPRETING THE RESULTS

There is an organized breast cancer screening programme, which reports newly diagnosed cases to the registry. Basal and squamous cell skin cancers are not registered. As per IARC recommendations, all bladder tumours (regardless of behaviour), all benign brain and other central nervous system tumours, and all benign tumours and in situ cancers of the breast and cervix are registered.

Spain, Girona

REGISTRATION AREA

The Girona Cancer Registry covers the province of Girona in the north of the autonomous community of Catalonia in north-eastern Spain. At the 2007 census, the population was 697 000. The majority of residents are Caucasian. In recent years, there has been a large increase in immigration from Africa and South America, with immigrants accounting for 18.8% of the population in 2007.

CANCER CARE FACILITIES

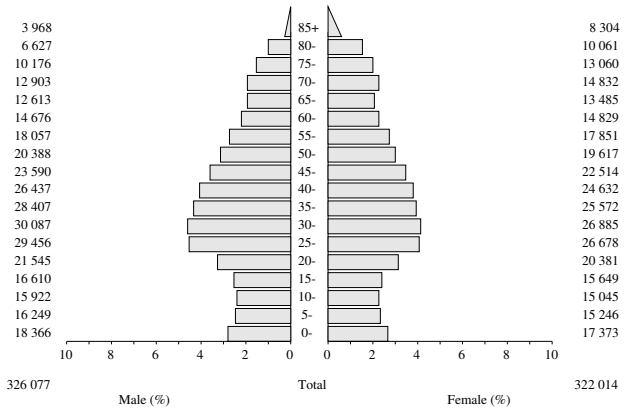
Health care is provided predominantly by the Spanish National Health System, through district hospitals and a network of primary health care centres. Radiotherapy, cancer surgery, and chemotherapy are coordinated by the cancer centre in the city of Girona and carried out at various general hospitals.

REGISTRY STRUCTURE AND METHODS

The registry began its activities in 1995. It is funded by the Department of Health of the Government of Catalonia as part of the Oncology Coordination Plan. Cancer notification is voluntary. The death registration system is adequate and complete; every year the registry analyses all death certificates. All records are interpreted, coded, updated, and processed. The registry uses the IARC/IACR rules for multiple primary tumours. Quality control is performed using the DEPedits program. The registry applies European Network of Cancer Registries (ENCR) rules to ensure confidentiality.

INTERPRETING THE RESULTS

An organized screening programme for breast cancer was started in the registration area in 1999. There is also an opportunistic cervical cancer screening programme. The use of prostate-specific antigen (PSA) testing increased during the registration period.



USE OF THE DATA

Registry data are published in annual incidence reports, and cancer incidence data serve as a basis for health planning. Studies on both the survival and treatment of patients with specific tumours are also being carried out.

Spain, Granada

REGISTRATION AREA

The Granada Cancer Registry covers the province of Granada (with 168 municipalities) in the autonomous community of Andalusia in southern Spain. In 2005, the population was 863 000, with 16% of residents aged 65 years or older. Granada has one of the lowest per capita incomes in Spain.

CANCER CARE FACILITIES

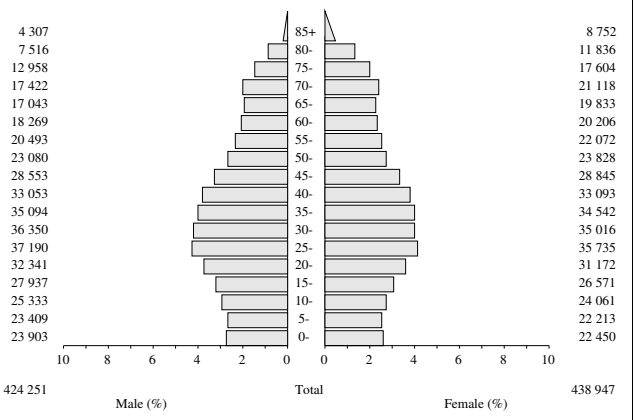
Residents have free access to the public health care system, which includes four public hospitals with a total of 2029 beds. The three private hospitals (with 345 beds) serve only a small population. Few resident cases are diagnosed or treated outside the province.

REGISTRY STRUCTURE AND METHODS

The registry, established in 1985, is supported by the Andalusian Regional Health Ministry and run by the Andalusian School of Public Health. Cancer notification is voluntary. The main information sources are automated discharge files and pathology reports from all hospitals. Data collection is both active and passive. Information based on primary health care is limited. The registry uses the IARC/IACR rules for multiple primary tumours.

INTERPRETING THE RESULTS

Undiagnosed cancer cases are uncommon, due to the availability of diagnosis and treatment. Because of confidentiality laws in effect since 2000, the registry cannot access death certificates, which could slightly decrease completeness, although the percentage of death-certificate-only (DCO) cases in previous periods was low. There has been a population-based breast cancer screening programme since 1997, and opportunistic prostate-specific antigen (PSA) testing is available.



USE OF THE DATA

The registry estimates incidence, trends, and survival and publishes statistics on its website (http://cancergranada.org/). The registry also participates in multicentre international studies on cancer care and survival, including EUROCARE, the European Cancer Health Indicator Project (EUROCHIP), CONCORD, and the European Prospective Investigation into Cancer and Nutrition (EPIC).

Average annual person-years by sex and age group

SOURCE OF POPULATION

Annual population estimates provided by the Spanish National Statistics Institute (INE; http://www.ine.es/inebmenu/mnu_cifraspob.htm), based on the 2001 census, with postcensal adjustments for births, deaths, and migration.

NOTES ON THE DATA

*No DCO registrations.

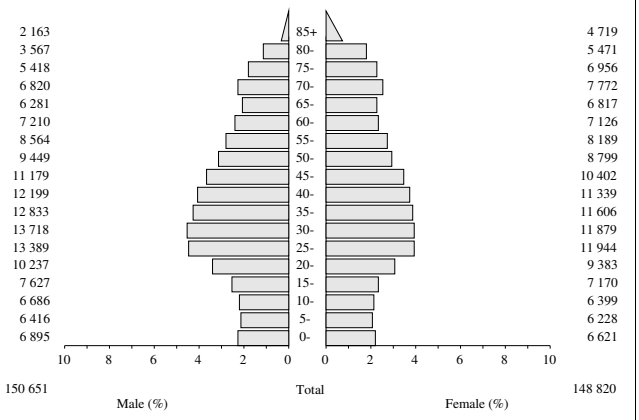
Spain, La Rioja

REGISTRATION AREA
The La Rioja Cancer Registry covers the autonomous community of La Rioja in northern Spain. The population accounts for 1% of the total Spanish population. Most residents are Catholic, and almost all are White.

CANCER CARE FACILITIES
Most of the population is covered by the public health system. The major cancer care facilities in La Rioja are the public hospital complex of San Millán-San Pedro (which provides cancer surgery and chemotherapy), the publicly owned and privately managed Calahorra Hospital Foundation (which provides cancer surgery), the private Los Manzanos Hospital (which provides cancer surgery), and the public General Hospital of La Rioja (which provides radiotherapy). Some patients with lung cancer or nervous system malignancies are referred for treatment in other regions. Palliative care mobile units have been operating since 2001, and there is one private pathology laboratory.



REGISTRY STRUCTURE AND METHODS
The registry was established by law in 1993 and complies with Organic Law 15/1999 relating to the protection of personal data. The registry is administered by the Epidemiology and Health Promotion Service of the Health and Social Services Department of the Government of La Rioja, and is staffed by a full-time physician, a part-time administrative professional, and a part-time nurse. Data collection is active, through review of paper medical records. Since 2004, the registry has also had online access to electronic medical records. Quality control is performed routinely, through internal validity checks and using the IARCcrgTools program.

INTERPRETING THE RESULTS
The observed increase in prostate cancer may be due to the increase in opportunistic prostate-specific antigen (PSA) testing. There is also a breast cancer screening programme.

USE OF THE DATA
The registry publishes annual incidence reports. Registry data are used to evaluate the impact of the area's screening programmes, and the registry is involved in several research studies, including a study on rare tumours in Spain.

† See note following population pyramid

Spain, Mallorca

REGISTRATION AREA

The Mallorca Cancer Registry covers the Spanish island of Mallorca, the largest of the Balearic Islands. In 2005, the population was 776 000 (23.9% born in other Spanish regions and 17.5% in other countries).

CANCER CARE FACILITIES

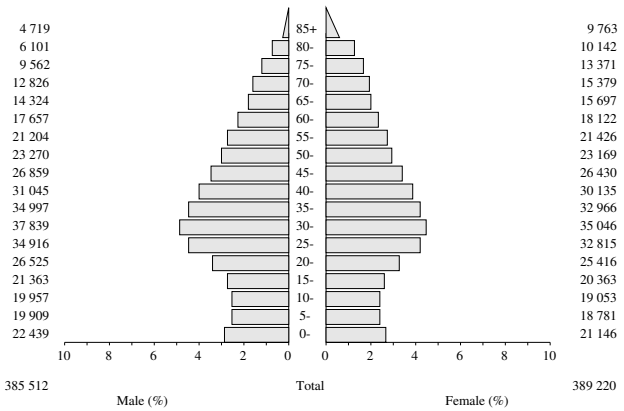
The Balearic Islands Health Services is part of the Spanish National Health System and covers 95% of the population, through a network of 40 primary health care centres and three public hospitals. There are also four private hospitals, and 29% of residents have private health insurance. All three public hospitals have oncology departments. Two hospitals (one private, one public) have radiotherapy services.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1988 by a non-profit organization (the Colorectal Cancer Study Group) and was funded by the regional government until 2008, when it became part of the Balearic Islands Public Health Department. The registry staff includes a full-time epidemiologist and physician, two part-time nurses, and a clerk. Notification of cancer is voluntary. Data collection is mostly passive, although active collection is performed for some cases. The registry has electronic access to primary health care and public hospital clinical records, and has had access to death certificates since 2008.

INTERPRETING THE RESULTS

A population-based screening programme for breast cancer was established among women aged 50–64 years in 1998, and was extended to women aged up to 69 years by 2007. An opportunistic screening programme for cervical cancer was established in 2003. Prostate-specific antigen (PSA) testing is very common, both within primary health care settings and in urological consultations.



USE OF THE DATA

The registry participated in volumes VII and VIII of *Cancer Incidence in Five Continents* and in EUROCARE-2, and is a founding member of the Spanish network of cancer registries (REDECAN), created in 2010. It provides support to cancer researchers working in the private and public health sectors at the local and national level, for either clinical or epidemiological purposes. The registry actively collaborates with other Spanish registries and also produces and publishes its own research.

SOURCE OF POPULATION

Annual population estimates provided by the Spanish National Statistics Institute (INE; http://www.ine.es/inebmenu/mnu_cifraspob.htm), based on the 2001 census, with postcensal adjustments for births, deaths, and migration for the Balearic Islands weighted to reflect the population size of Mallorca.

NOTES ON THE DATA

REGISTRATION AREA

The Murcia Cancer Registry (RCM) covers the Region of Murcia, an autonomous community in south-eastern Spain. In 2005, the population was 1.3 million (17% children). About 11% of working residents work in agriculture, 62% in services, and 27% in industry.

CANCER CARE FACILITIES

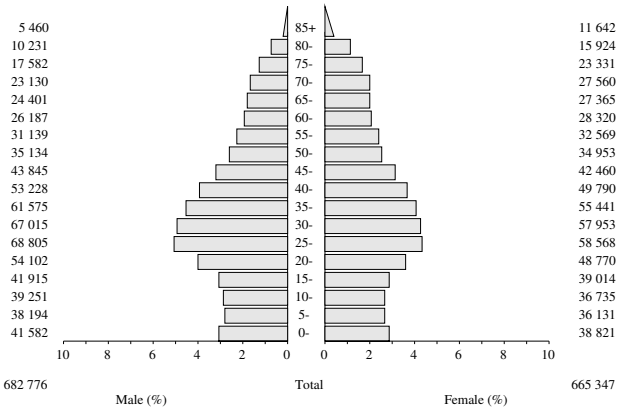
Primary health care and hospital services are provided through the Spanish National Health System. The region has six health districts, each with at least one public hospital. There are 25 hospitals in total (12 public and 13 private), with 4317 beds (73% in public hospitals).

REGISTRY STRUCTURE AND METHODS

The RCM was established in 1981 as a project of the Murcia Ministry of Health. Case ascertainment is based on information from hospitals and pathology services. RCM staff members also visit health centres and check clinical documentation. The registry has recently received online access to clinical records. The RCM also receives notifications from the Spanish National Childhood Cancer Registry and the social security service. The proportions of death-certificate-only (DCO) cases are used for monitoring quality control.

INTERPRETING THE RESULTS

There is an opportunistic screening programme for cervical cancer, and 65% of women have undergone cytology screening at some point. Opportunistic prostate-specific antigen (PSA) testing is also available. Population-based screening for breast cancer started in 1995, with a 71% participation rate. A screening programme for colorectal cancer was initiated in 2005 in two health districts, with a 51% participation rate.



USE OF THE DATA

The RCM's main purpose is to estimate cancer incidence and survival in the region. Data are also used for the planning and evaluation of cancer control programmes. The RCM has participated in multicentre studies, such as the European Prospective Investigation into Cancer and Nutrition (EPIC) and EUROCARE. The RCM is a member of the Iberoamerican network of epidemiology and cancer information systems (REDEPICAN).

Spain, Navarra

REGISTRATION AREA

The Navarra Cancer Registry covers the autonomous community of Navarra in northern Spain. In 2005, the population was 593 000, with 14% aged less than 15 years and 17.5% aged more than 65 years. About 50% of residents live in Pamplona (the capital) and the surrounding area (and 33% live in Pamplona proper).

CANCER CARE FACILITIES

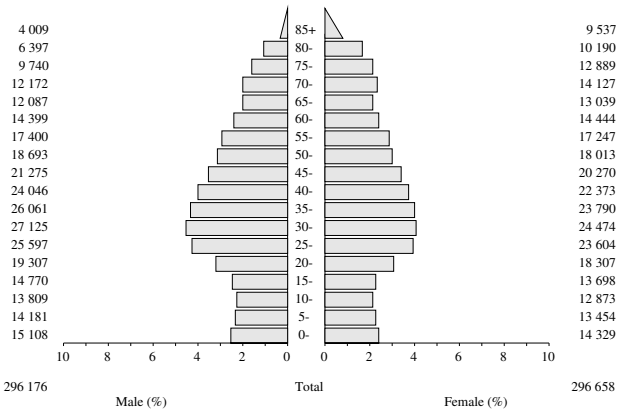
The public health system covers 95% of the population. There are three areas with referral hospitals. Cancer care is based on primary prevention (promotion of healthy lifestyles), secondary prevention (screening for breast cancer), and tertiary prevention. All patients suspected to have cancer receive the appropriate diagnostic tests. Cancer treatment and follow-up is provided by both the public and the private sectors.

REGISTRY STRUCTURE AND METHODS

The registry is staffed by an epidemiologist, two nurses (who collect and code the data), and an administrative assistant. An advisory committee also works with the registry. Notification of cancer cases is voluntary. Data are actively collected from the records of pathology, haematology, radiotherapy, and oncology services. Incidence data are complemented with information from the mortality registry. Data are collected using forms and stored electronically. The registry routinely performs quality checks, and uses the IARC/IACR rules for multiple primary tumours. Since 2003, data have been coded according to ICD-O-3.

INTERPRETING THE RESULTS

During the registration period there were no changes in the area covered or the availability of diagnostic or treatment services.



USE OF THE DATA

The registry publishes periodic incidence reports. It also promotes and facilitates research and provides information required for the planning and evaluation of activities and programmes against cancer. The registry collaborates on major multicentre studies such as the European Prospective Investigation into Cancer and Nutrition (EPIC), MCC-SPAIN, EUROCARE, and EUROPREVAL. Registry data are submitted to various IARC initiatives, such as *Cancer Incidence in Five Continents*, the European Cancer Incidence and Mortality (EUROCIM) database, and the Automated Childhood Cancer Information System (ACCIS).

Spain, Tarragona

REGISTRATION AREA

The Tarragona Cancer Registry covers the province of Tarragona in the autonomous community of Catalonia in north-eastern Spain. About 84 000 residents of the province are immigrants, with 23 000 from Morocco, 31 000 from Europe, and 19 000 from Central and South America. Among working residents, 6% work in agriculture, 20% in industry, 16% in construction, and 58% in the service sector.

CANCER CARE FACILITIES

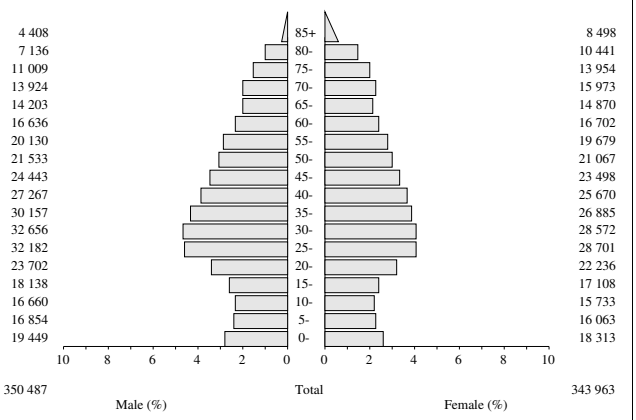
Almost all residents are covered by the Spanish National Health System, and most residents normally use its services. In 2005, the province had about 2900 physicians, seven public hospitals (with 1250 beds), and three private hospitals (with 100 beds). One of the public hospitals has an oncology department (with 32 beds), which includes medical oncology, radiotherapy, and palliative care units.

REGISTRY STRUCTURE AND METHODS

The registry belongs to the Foundation Society for Cancer Research and Prevention. The registry staff includes a director, an epidemiologist, a computer scientist, two nurses, a statistician, and a clerk. Notification of cancer is voluntary. Data are collected through passive or automated notification for most sources, and by active search for the rest. The registry uses mortality data from the Catalan Mortality Registry and the Spanish National Death Index. Cases notified by a death certificate are systematically traced and are registered as death-certificate-only (DCO) cases only if no further information can be obtained. Several types of checks (online and in batch mode) are used to detect errors and inconsistencies.

INTERPRETING THE RESULTS

The completeness of the registry exceeds 95%. Since the registry began in 1980, the availability of diagnostic and treatment services has increased, but it is difficult to estimate the influence on incidence trends. Approximately 42 000 annual cervical cytological examinations were carried out during the registration period. A population-based breast cancer screening programme was started in 1998 for women aged 50–69 years. The rate of prostate-specific antigen (PSA) testing was quite high during the registration period, but its influence on prostate cancer incidence is unknown.



USE OF THE DATA

The registry regularly publishes several sets of cancer statistics and describes the various cancers' epidemiological characteristics and evolution. It also promotes epidemiological research, helps policy-makers identify needs for cancer care services, and collaborates in evaluating screening programmes and other cancer control activities.

Sweden

REGISTRATION AREA

The Swedish Cancer Registry covers all of Sweden, which has an area of 450 000 km^2 and had a population of 9.4 million in 2010. The population is unevenly distributed across the country, with most residents living in the south. About 85% of residents live in localities (defined as having more than 200 residents) and 40% live in towns or cities with more than 50 000 residents. The country is secular, although 70% of residents are members of the Church of Sweden.

CANCER CARE FACILITIES

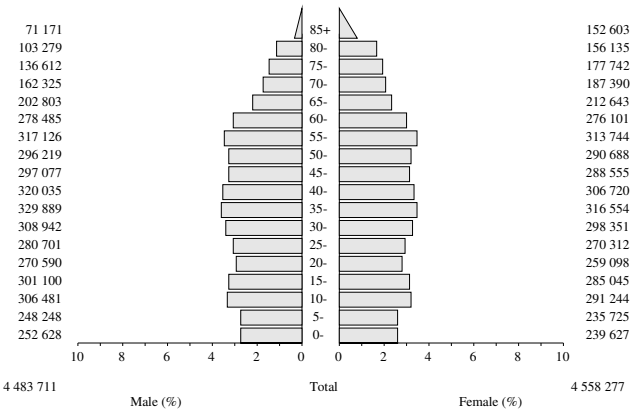
There are 29 500 physicians in Sweden (313 per 100 000 residents). Cancer care is incorporated into the general health care system. There are six regional cancer centres that coordinate cancer care and regional cancer registries.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1958 and is run by the Swedish National Board of Health and Welfare. The regional cancer registries are responsible for registering new cases and performing the major checks and correction work. The registration of newly detected tumours is based on mandatory reporting by all physicians in public and private facilities. Hospital and forensic pathologists make independent mandatory reports on every cancer diagnosis made from surgical biopsies, cytological specimens, and autopsies. The cancer registry data are supplemented with information on cause and date of death through linkage with the Swedish Cause of Death Register. The Swedish Cancer Registry does not register cases based on death certificates only.

INTERPRETING THE RESULTS

The completeness of the registry is estimated to be 96%. There are two national screening programmes: one for breast cancer and one for cervical cancer. Prostate-specific antigen (PSA) testing is not part of an organized programme, but it has been very common since the mid-1990s. There is a screening trial under way for colorectal cancer in the Stockholm-Gotland region.



USE OF THE DATA

The registry's statistical database and annual incidence reports are available from http://www.socialstyrelsen.se/. Registry data are also used for quality assurance of public health services (such as programmes to improve cancer prevention and survival) and for clinical and epidemiological research.

Switzerland, Basel

REGISTRATION AREA

The Basel Cancer Registry covers the cantons of Basel-Stadt and Basel-Landschaft (an area of 465 km^2) in north-western Switzerland. In 2008, the population was 462 000 (19% aged more than 65 years and 18% aged less than 20 years). Foreign residents (mostly from Italy, Montenegro, Serbia, Turkey, Germany, and Spain) accounted for 24% of the population. About 85% of residents live in the conurbation of Basel. About 30% of residents are Protestants, 25% Roman Catholics, and 45% of other denominations or no religion; 1% work in agriculture and forestry, 25% in industry, and 71% in services (3% are unemployed).

CANCER CARE FACILITIES

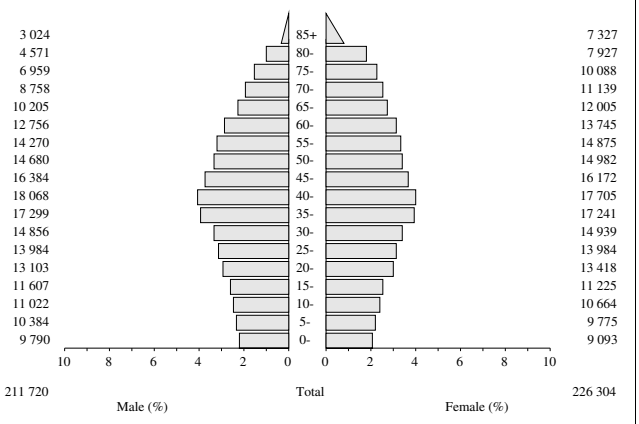
There are 3561 hospital beds (12 per 1000 residents): 71% in nine central hospitals and the rest in 16 private hospitals. There are three radiotherapy facilities but no separate specialized cancer clinics. Outpatient care is provided by 1119 physicians (1 per 413 residents).

REGISTRY STRUCTURE AND METHODS

The registry was established in 1969 and started collecting population-based data in 1970. It is located within the pathology department of the University of Basel and is run by a part-time pathologist, two full-time registrars, and two part-time registrars. It is funded by the cantonal governments and the federal government. Cases are voluntarily reported by two pathology departments, two hospital-based pathology laboratories, three private pathology laboratories, two haematology laboratories, and three radiotherapy units. Treating physicians are asked for additional information (with a 90% response rate). Date of death is supplied by the official population registries, and death certificates are used for case finding. The registry has permission (from the Central Governmental Commission for Data Protection in Medical Research) to receive non-anonymized data on cancer patients. Active follow-up is carried out within the framework of EUROCARE.

INTERPRETING THE RESULTS

There are no organized screening programmes.



USE OF THE DATA

Annual incidence data are published in collaboration with the Swiss National Institute for Cancer Epidemiology and Registration (NICER), which was founded by the Swiss Cancer Registries Network. The registry has conducted descriptive epidemiological studies in collaboration with the Basel Familial Cancer Registry, NICER, the Swiss Institute for Applied Cancer Research, EUROCARE, and IARC.

Switzerland, Geneva

REGISTRATION AREA

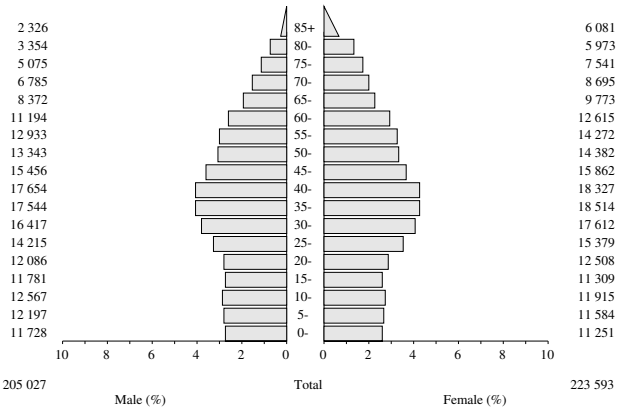
The Geneva Cancer Registry covers the canton of Geneva in western Switzerland. The canton has a total area of 282 km^2, of which Lake Geneva covers 36 km^2. In 2007, the population was 448 000 (15% aged 65 years or more). The population structure is a result of a low fertility rate, a high life expectancy, and fairly heavy immigration (often temporary, and traditionally from Latin countries) at the ages of economic activity. Due to restrictive citizenship policies, the proportion of the population considered foreign remains high, at 38.4%. Economic activity is concentrated in the administrative and service sectors.

REGISTRY STRUCTURE AND METHODS

The registry was founded in 1969 and began registering cases in 1970. Since 1999, it has been affiliated with the University of Geneva. The registry is staffed by 12 employees, including three physicians and two statisticians. Data obtained from biopsies (which are carried out mainly at the central laboratory or in other specialized services of the public hospital) are electronically transmitted to the registry each month for linkage with the registry database. Five private pathology laboratories provide records to the registry (or permit systematic consultation of their files). Additional data collection is performed by examining the records of relevant public services and sending a questionnaire to private practitioners (with a 90% response rate). The registry has access to records from the public hospital's oncology department and two private radiation oncology centres, as well as to all death certificates issued in the canton. The registry annually performs active follow-up of all cases.

INTERPRETING THE RESULTS

A very low percentage of cases (less than 1% in 1998–2002) are registered from death certificates only. The low rate of cases found at autopsy (0.7% in 1998–2002) compared with the total number of histologically confirmed cases suggests that most cases are identified during patients' lifetimes. A breast cancer screening programme was launched in 1999. Prostate-specific antigen (PSA) testing is common.



USE OF THE DATA

Policy-makers do not use the registry's data to evaluate health services, but the registry has received an official mandate to evaluate the breast cancer screening programme. The registry publishes routine incidence and survival data, and also initiates and participates in analytical epidemiological investigations. Several case–control and cohort studies have been undertaken for etiological and evaluative purposes.

Switzerland, Graubünden and Glarus

REGISTRATION AREA

The Graubünden and Glarus Cancer Registry covers the cantons of Graubünden and Glarus (an area of 7790 km^2) in the alpine region of south-eastern Switzerland. Because of its geography, the region is sparsely populated; the biggest city has 33 000 residents. Most of the region's 224 000 residents live in isolated cities or rural areas. The region is trilingual, with about 70% of the population speaking German, 15% Romansh (a Romance language), and 10% Italian. Most of the population is employed in the services sector. Tourism is a pillar of the regional economy, together with industry, particularly in the canton of Glarus.

CANCER CARE FACILITIES

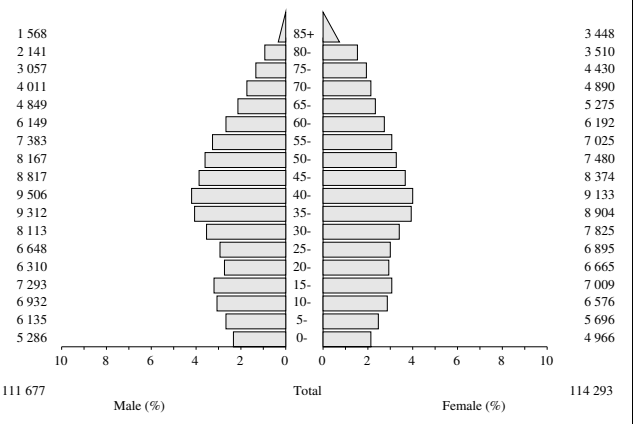
There are two main multidisciplinary hospitals, about 10 regional hospitals, and a network of practitioners covering the area. Medical, radiation, and surgical oncology services are provided at the cantonal hospital, and medical oncologists provide consultations through a mobile consultation service. About 5% of resident cases are treated outside the area in the neighbouring cantons of St Gall, Zurich, and Ticino.

REGISTRY STRUCTURE AND METHODS

As per special authorization by an expert commission of the Swiss Federal Office of Public Health, any resident cancer cases treated in areas covered by other registries are reported by those registries to the Graubünden and Glarus Cancer Registry. Notification is voluntary for pathologists, physicians, and hospitals. The registry is based in the pathology department of the Graubünden cantonal hospital. Two registrars manually code the received data and actively search for additional information on stage and initial treatment. Quality control and completeness checks are performed periodically.

INTERPRETING THE RESULTS

A population-based quality-assured mammography screening programme was started in Graubünden in 2011. Opportunistic screening for cervical cancer and prostate-specific antigen (PSA) testing for prostate cancer are widely used.



USE OF THE DATA

Annual incidence and mortality statistics by age and site are available from the registry's website (http://www.krebsregister-gr.ch). The registry also publishes a bulletin (3–4 times per year) with information on specific types of cancer, and contributes data for national and international research projects (such as EUROCARE and CONCORD).

Switzerland, Neuchâtel

REGISTRATION AREA

The Neuchâtel Cancer Registry covers the French-speaking canton of Neuchâtel in western Switzerland, which shares a border with France. The canton is mainly rural, with only two cities (of approximately 35 000 residents each). Almost all residents are Caucasian; 38% are Protestant and 31% are Catholic. Foreign residents (predominantly of Mediterranean origin) account for about 23% of the population. The main occupational sectors in the canton are watch-making and the microtechnical industry (35%), agriculture (4%), and services (61%).

CANCER CARE FACILITIES

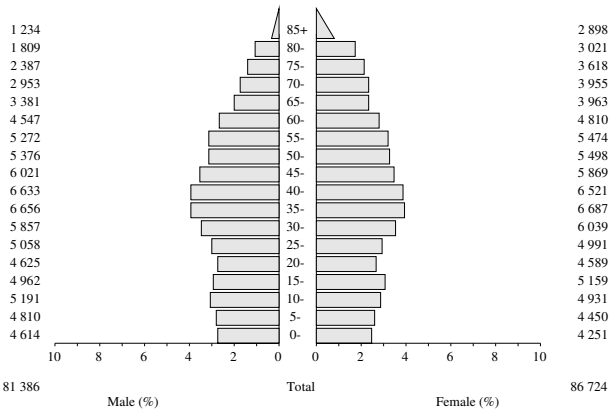
In 2005, the registration area had about 570 hospital beds available for cancer diagnosis and treatment (about 3 per 1000 residents). There were 357 practising physicians (1 per 473 residents). Radiotherapy and oncology services are provided through a unique coordinated multisite public organization covering the entire area.

REGISTRY STRUCTURE AND METHODS

The bulk of information is provided by the Neuchâtel Institute of Pathology (INAP) through submission of biopsy, cytology, and autopsy reports. Notification is voluntary for medical institutions. Additional information is abstracted by the registry staff from computerized hospital charts. The registry routinely integrates abstracts of medical records into its database, and performs periodic electronic linkage between the registry database and the centralized cantonal administrative population database (for the purpose of active follow-up). All death certificates are checked annually against the registry files.

INTERPRETING THE RESULTS

A mammography breast cancer screening programme (for women aged 50–69 years) was initiated in 2007, and the average annual participation rate is 59%. Dermatologists, in collaboration with the Neuchâtel League Against Cancer, conduct annual campaigns for early detection of skin cancers.



USE OF THE DATA

The registry publishes routine annual incidence and mortality data by sex, age, and primary site; provides data for local planning purposes; and contributes anonymized annual incidence data to the national database of the Swiss National Institute for Cancer Epidemiology and Registration (NICER). The registry also conducts epidemiological studies in collaboration with the Vaud Cancer Registry.

Switzerland, St Gall-Appenzell

REGISTRATION AREA

The St. Gallen-Appenzell Cancer Registry covers the cantons of St Gall, Appenzell Ausserrhoden, and Appenzell Innerrhoden (an area of 2430 km^2) in north-eastern Switzerland. The population is 517 000 (87% in the canton of St Gall). Much of the area is rural. The most important industries are the metal industry (machines and vehicles) and construction, which are widely distributed throughout the region. Five sixths of residents are Swiss, and the rest are mainly of other European origins.

CANCER CARE FACILITIES

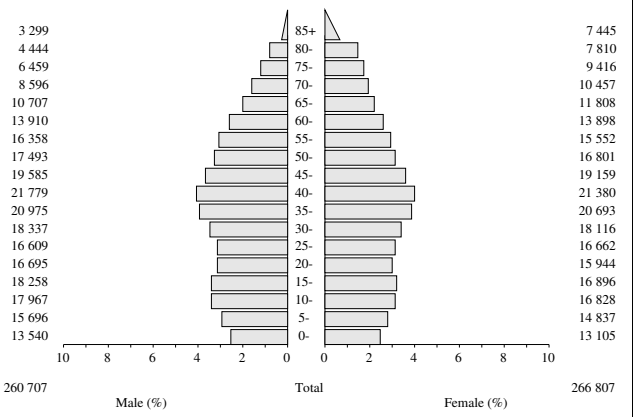
The central hospital in the city of St Gall provides specialized oncology services, including medical and radiation oncology. There are 10 consultant oncologists in the registration area. Most cancer patients are treated at the central hospital or one of the acute hospitals within the region at least once during the course of their disease. Some patients in areas adjacent to the urban canton of Zurich seek care there.

REGISTRY STRUCTURE AND METHODS

Cancer notification is voluntary. The registry primarily ascertains cases through the active and passive collection of reports from the central pathology laboratory. The registry also actively collects data from the other pathology laboratories in the region and from all regional acute hospitals. The registry reviews files from the central hospital's departments of oncology, haematology, radiotherapy, neurosurgery, and paediatrics, as well as its geriatric clinic. The registry routinely exchanges information with the other Swiss cancer registries, particularly those covering the neighbouring cantons of Zurich and Graubünden. All death certificates with a cancer diagnosis are reviewed, and trace-back procedures are used. Periodic quality control and completeness checks are performed. The registry is affiliated with the Cancer League St. Gallen-Appenzell.

INTERPRETING THE RESULTS

A population-based mammography screening programme was initiated in the canton of St Gall in 2010. Opportunistic screening for cervical cancer and prostate-specific antigen (PSA) testing for prostate cancer are widely used.



USE OF THE DATA

Annual incidence and mortality statistics by age and site are published online at http://www.krebsliga-sg.ch/de/krebsregister/. The registry also contributes data to national and international research projects (such as EUROCARE and CONCORD).

Switzerland, Ticino

REGISTRATION AREA

The Ticino Cancer Registry covers the canton of Ticino in southern Switzerland. In 2005, the population was 322 000 (74% Swiss and 26% immigrants). The official language is Italian. The economy is based mainly on the services sector (80%), followed by industry and manufacturing (18%) and farming and forestry (2%).

CANCER CARE FACILITIES

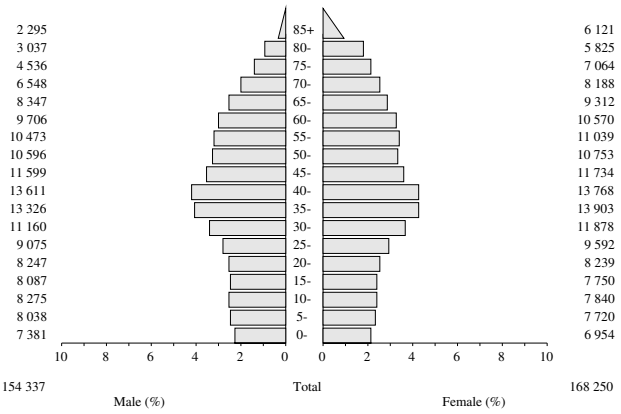
During the reporting period, there were four public hospitals, six private facilities, and one radiotherapy department in the canton.

REGISTRY STRUCTURE AND METHODS

The registry was established by cantonal law in 1995 and became active in 1996. The local government provides most of the registry's funding. The registry is located within the Ticino Cantonal Institute of Pathology and is staffed by a full-time physician, two data managers (one full-time and one part-time), and a full-time statistician. It actively collects data on all malignant invasive and in situ tumours. All data are checked and manually coded (according to ICD-O-3) by registry staff members before being entered into the database. Initial plausibility tests are automatically performed during the data entry phase. Other periodically conducted checks and procedures include IARC checks and multiple primary rules and several other plausibility, validity, and consistency checks (such as the logical sequence of dates; the validity of codes; and morphology by topography, sex, and age). Active follow-up of all cancer patients is performed annually, through consultation of the cantonal population office's electronic records.

INTERPRETING THE RESULTS

There are no population-based cancer screening programmes, but opportunistic screening is available for breast, cervical, and prostate cancers.



USE OF THE DATA

Policy-makers often use registry data to plan and evaluate health services. The registry also promotes and is involved in local, national, and international epidemiological research (e.g. analysis of prognostic factors, incidence, and survival), such as EUROCARE, HAEMACARE, RARECARE, CONCORD, the European Cancer Incidence and Mortality (EUROCIM) database, and the Swiss HIV Cohort Study. Further information about the registry's activities is available from its website (http://www.ti.ch/cancer/), which is updated regularly.

Switzerland, Valais

REGISTRATION AREA

The Valais Cancer Registry covers the canton of Valais (an area of 5225 km^2) in southern Switzerland. In 2009, the population was 307 000. About 30% of residents live in urban areas; the rest live in the mountainous rural region of the Alps. About 29.5% of residents live in the German-speaking area (Upper Valais) and 71% in the French-speaking areas (Central Valais and Lower Valais). Foreign residents (mainly from Italy, Portugal, Montenegro, and Serbia) account for 20% of the population.

CANCER CARE FACILITIES

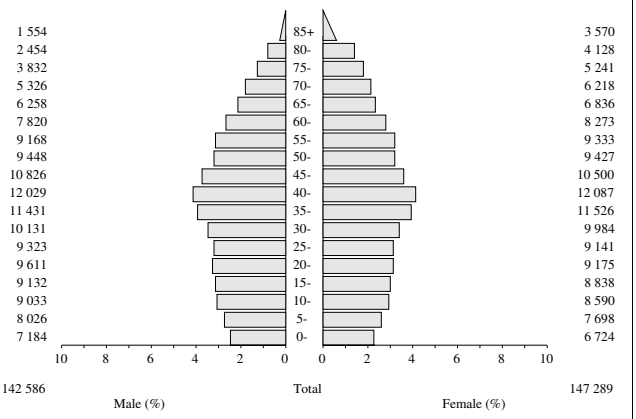
General health care in the region is provided predominantly by the Hospital of Valais (which has 11 sites and a central institute) and one private clinic. This is supplemented by 687 private practitioners (22 per 10 000 residents). Patients suspected to have cancer are most often referred to the main hospital in Sion (the capital of the canton), which has an oncology department with several specialists, a cancer surgery service, and a centralized radiotherapy service. Cases requiring additional facilities are typically treated in university centres such as Lausanne and Geneva (for French-speaking patients) and Bern and Zurich (for German-speaking patients).

REGISTRY STRUCTURE AND METHODS

The registry, located in Sion, has been administrated by the Valais Health Observatory (http://www.ovs.ch/) since 2002. The registry is financed primarily by the canton of Valais, and the Swiss National Institute for Cancer Epidemiology and Registration (NICER) provides about 15% of the total funding. The registry is staffed by a physician, a half-time registrar, and two part-time secretaries. It uses active case finding from several sources (pathology laboratories, hospitals, departments of oncology and radiotherapy, other Swiss cancer registries, and death certificates). The registry has collected data on all malignant invasive and in situ tumours and all brain tumours in residents of the canton since 1989.

INTERPRETING THE RESULTS

A mammography screening programme (for women aged 50–70 years) was initiated in 1999, and had a participation rate of about 68% in 2007. Opportunistic screening for cervical cancer is common.



USE OF THE DATA

Registry data are used to inform public health planners, health professionals, and the general population about cancer within the population. Anonymized data are transmitted to NICER for incidence, mortality, and survival analysis.

Switzerland, Vaud

REGISTRATION AREA

The Vaud Cancer Registry covers the French-speaking canton of Vaud, which is the fourth largest of the 26 cantons in Switzerland. The canton is composed of 375 communes (only 12 of which have more than 10 000 residents) grouped into 19 administrative and political districts. The population density (230 residents/km^2) is slightly higher than the national average. In 2005, only 23% of Vaud residents were aged less than 19 years, and 15% were aged 65 years or more. Immigrants (predominantly of Mediterranean origin) accounted for about 28% of residents. The main occupations are in industry (19%), agriculture and fishing (4%), and services (76%). Although Lausanne (the canton's capital) and its suburbs cover only 4% (115 km^2) of the canton's area, it is home to about 30% of the canton's total population.

CANCER CARE FACILITIES

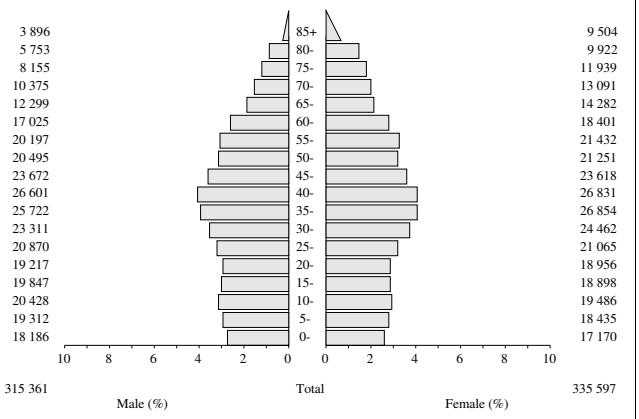
In 2005, the registration area had about 3200 hospital beds available for cancer diagnosis and treatment (about 5 per 1000 residents). There were about 3600 hospital medical residents and private practitioners (1 per 180 residents). The canton has a major, multidisciplinary, public university oncology and radiotherapy centre and two private radiotherapy units (available to all residents), as well as several peripheral (mostly hospital-based) medical and surgical oncology facilities and specialists.

REGISTRY STRUCTURE AND METHODS

The registry is part of the Cancer Epidemiology Unit of the Institute of Social and Preventive Medicine within the Faculty of Biology and Medicine of the University of Lausanne. Notification is voluntary. The registry's main sources of information are the University Institute of Pathology at the University of Lausanne and three major private pathology laboratories. Passive and active follow-up are conducted. Data on all deaths in the canton (including cancer deaths) are available. Other features of the registry are good registration of non-melanoma skin cancers, linkage of reports of selected preneoplastic conditions to the registry database (to study subsequent cancer risk), analysis of the risk of second neoplasms for patients registered with a defined primary, and systematic analyses of trends in survival.

INTERPRETING THE RESULTS

A mammography breast cancer screening programme for women aged 50–69 years (about 75 000 women in total) was initiated in 1999.



USE OF THE DATA

Registry data are used for hospital-based case–control studies on head and neck, colorectal, breast, endometrial, and thyroid cancers. They are also used to evaluate the breast cancer screening programme.

Switzerland, Zurich

REGISTRATION AREA

The Zurich Canton Cancer Registry covers the predominantly urban, German-speaking canton of Zurich in Switzerland (an area of 1729 km^2). In 2005, the population was 1.3 million, making Zurich the most populous of the 26 Swiss cantons. Immigrants (mostly from eastern and southern Europe and Germany) account for 22% of the population. About 37% of residents are Protestant and 29% Roman Catholic.

CANCER CARE FACILITIES

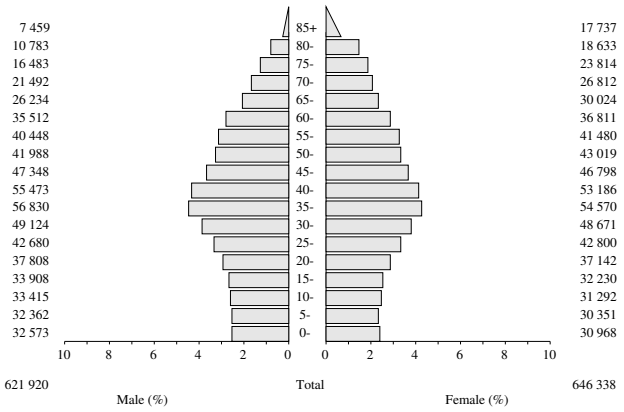
Health care is provided by more than 40 public or private cantonal hospitals and clinics, some with special oncology and/or radiation oncology departments. There is a mandatory basic health insurance system and a national cancer programme.

REGISTRY STRUCTURE AND METHODS

The registry was established by cantonal resolution in 1980. It is affiliated with the Institute of Surgical Pathology at the University Hospital Zurich and the Institute of Social and Preventive Medicine at the University of Zurich. The registry is financed by the canton, the federal government, and third-party funds. Notification is voluntary, and a federal law allows cancer registries to receive non-anonymized data. The registry is staffed by three physicians specializing in public health, five registrars, and a database manager. The main information sources are reports from pathology and haematology laboratories. Patient lists with cancer-specific ICD-10 codes from hospital files and medical records are additional sources. Most of these files are actively abstracted by the registry staff. Treating physicians are asked for further information when needed. Date of death is supplied by official population registries and by the Swiss Federal Statistics Office. Death certificates are used for additional case finding. All information is manually checked and coded. Plausibility checks are performed regularly by the database manager. Additional checks are done before national analysis.

INTERPRETING THE RESULTS

Registry coverage is estimated to be high and stable. There are no organized cancer screening programmes in the canton, but opportunistic screening for breast, cervical, and prostate cancers is common.



USE OF THE DATA

Registry data are used to produce annual cantonal cancer incidence and mortality statistics and national statistics to help policy-makers in planning and evaluating health services. The registry also participates in national and international clinical and epidemiological studies.

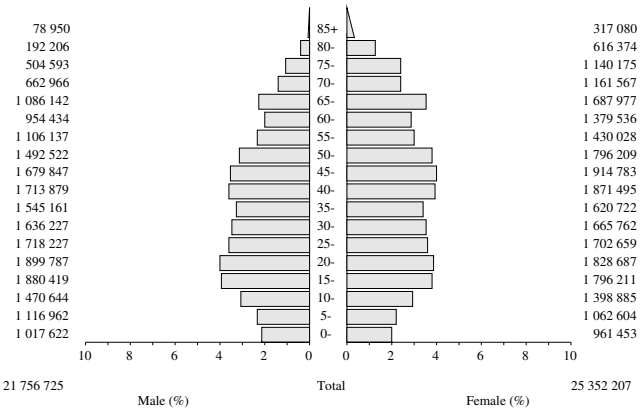
Ukraine

REGISTRATION AREA
The National Cancer Registry of Ukraine (NCRU) covers all of Ukraine. The population is about 47 million and has been steadily decreasing since the mid-1990s. About 66% of residents live in urban areas.

CANCER CARE FACILITIES
There are 43 oncology centres and 735 oncology departments and offices that provide cancer care and report cancer cases. Two state cancer programmes have been implemented, called Oncology 2002–2006 and Children's Oncology 2006–2010.



REGISTRY STRUCTURE AND METHODS
The NCRU started in 1989 and received legislative approval by order of the Ministry of Health of Ukraine in 1996. The NCRU operates as a distributed network. The central unit is a department of the Ukrainian National Cancer Institute; it collects all personal data from regional cancer registries, which gather information on each cancer case or death that occurs in their respective regions. There is also a network of hospital-based cancer registries. The standardization of the information technologies used by the hospital- and population-based registries and the capacity for data exchange between them are particularly relevant for improving the quality and completeness of cancer data, and are major prerequisites for creating a common information medium in oncology. The NCRU procedures for data quality control are based mainly on IARC recommendations, including checks of data accuracy, consistency, and integrity. These procedures include automatic coding of certain data attributes (ICD and ICD-O codes are derived from registered site and morphology of the tumour), checking disease stage based on the TNM indices registered, and checking for correct registration of multiple primary tumours. Particular attention is paid to avoiding and eliminating duplicate records.

INTERPRETING THE RESULTS
As part of the Oncology 2002–2006 programme, several screening programmes were implemented for the period 2002–2006: for cancers of the cervix, breast, colon and rectum, prostate, skin, and oral cavity.

USE OF THE DATA
The registry publishes the *Bulletin of the National Cancer Registry: Cancer in Ukraine*, which is available from the NCRU website (http://users.i.kiev.ua/~ucr/). NCRU technology and data are also used for the planning and evaluation of regional health services, scientific research on the consequences of the Chernobyl accident, and survival analysis.

United Kingdom, England

REGISTRATION AREA

The England data submitted for this volume cover a population of more than 50 million. Most residents live in metropolitan or smaller urban areas, and the rest live in mixed urban/rural areas. At the 2001 census, 91% of residents described themselves as White, 4.6% as Asian, 2.3% as Black, and 2.1% as mixed, Chinese, or other ethnic groups.

CANCER CARE FACILITIES

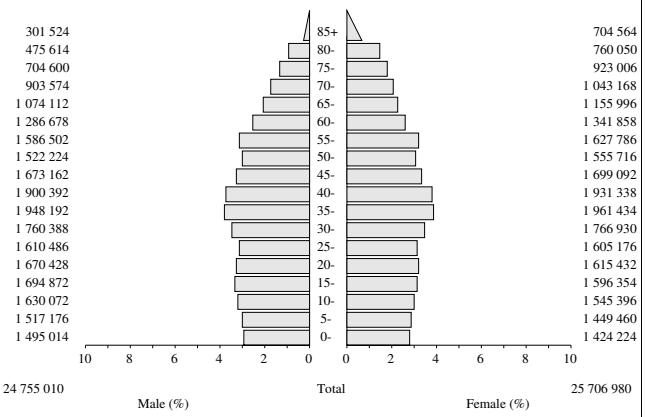
Cancer patients are treated within the National Health Service (NHS), which is free at the point of use. A minority of patients receive care within the private sector. Cancer services were restructured in 1995; cancer specialists now work in multidisciplinary teams, with services concentrated in specialized centres. Waiting-time targets have been set and cancer audits established. These initiatives were reinforced by the NHS Cancer Plan published in 2000.

REGISTRY STRUCTURE AND METHODS

Cancer is not a reportable disease in England. The collection of personally identifiable information is permitted by a special provision within the NHS Act 2006. Tumours diagnosed in 2003–2007 were registered by eight population-based registries that collectively cover all of England. The data included in this volume were submitted from the National Cancer Data Repository (NCDR), which provides annual aggregate information for England. Data are collected from sources including hospital records, pathology reports, and waiting-time datasets, but the registries' methods vary. Each registry is notified by the national death registration system of all resident deaths with a death certificate mentioning cancer.

INTERPRETING THE RESULTS

A breast screening programme was established for women aged 50–64 years in 1988, and was extended to women aged up to 70 years in 2005. Cervical screening is offered to women aged 25–64 years. A colorectal screening programme for residents aged 60–69 years was initiated in 2006.



USE OF THE DATA

The England registries perform a variety of public health surveillance and health protection functions and provide information to health organizations and researchers. The registries are the only source of reliable, population-based cancer incidence, prevalence, and survival data, which are essential for the implementation and monitoring of key national initiatives, such as the Cancer Reform Strategy (2007).

† See note following population pyramid

United Kingdom, England, East of England Region

REGISTRATION AREA

The Eastern Cancer Registry and Information Centre (ECRIC) covers the East of England region (composed of the counties and districts of Norfolk, Suffolk, Cambridgeshire, Bedfordshire, Hertfordshire, Essex, Peterborough, Luton, Bedford, Southend, and Thurrock). In 2011, the population was 5.7 million, with 90% of residents describing themselves as White British. ECRIC took over responsibility for the coverage of Hertfordshire, Essex, Southend, and Thurrock from the Thames Cancer Registry in 2005–2006.

CANCER CARE FACILITIES

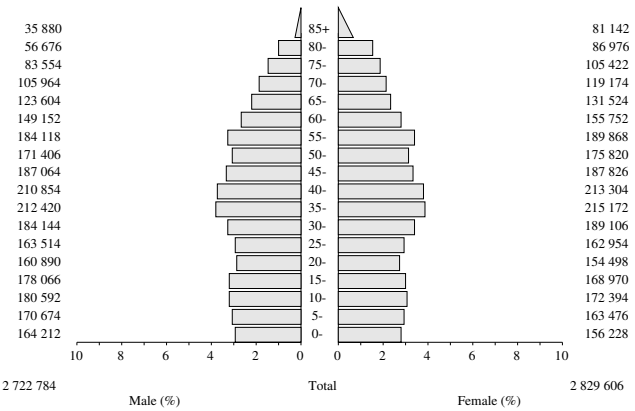
There are 18 main hospital trusts, 10 of which are tertiary centres for cancer treatment and seven of which have radiotherapy facilities.

REGISTRY STRUCTURE AND METHODS

ECRIC is located at the Cambridge University Hospitals National Health Service Foundation Trust and has officers posted in seven other trusts in the region. It is funded by the UK Department of Health under the public health budget and has 38 staff members. The registry has online access to patient records at seven regional trusts and collects data from more than 20 sources. Summarized data are then provided to one of the clinicians for staging. More than 75% of all invasive neoplasms are staged. Performance indicators are evaluated annually by the UK Association of Cancer Registries.

INTERPRETING THE RESULTS

A breast screening programme was established for women aged 50–64 years in 1988, and was extended to women aged up to 70 years in 2005. Cervical screening is offered to women aged 25–64 years. A colorectal screening programme for residents aged 60–69 years was initiated in 2006.



USE OF THE DATA

ECRIC data are extensively used in planning and evaluating cancer services in the East of England, and ECRIC staff members coauthor approximately 15 papers each year in peer-reviewed journals.

Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on (1) 2010 Small Area Population Estimates provided by the UK Office for National Statistics (ONS) in Titchfield, England, making allowances for births, deaths, and internal and external migration, and (2) aggregated data from lower super output areas (LSOAs) and English cancer registries, supplied by the UK Association of Cancer Registries.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Please note that as of 1 April 2013, this registry is now part of Public Health England.

United Kingdom, England, North Western

REGISTRATION AREA

The North Western Regional Cancer Registry covers the North West Health Region of England (composed of the counties of Greater Manchester, Lancashire, southern Cumbria, and a small part of Derbyshire), with an area of 4500 km^2. The population is 4 million, with 65% living in the conurbation of Greater Manchester, which is almost entirely urban. The rest of the region is of mixed urban, industrial, and rural character. About 11% of residents live in coastal areas, which are characterized by a high proportion of elderly retired residents.

CANCER CARE FACILITIES

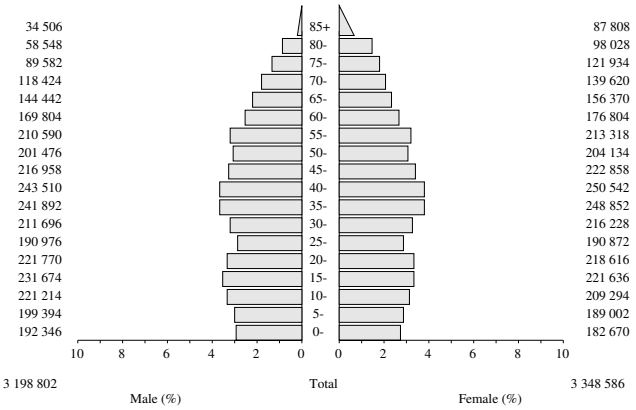
Most patients receive hospital care in National Health Service (NHS) hospitals, but the private sector is growing.

REGISTRY STRUCTURE AND METHODS

The registry was founded in 1962 and is part of the Centre for Cancer Epidemiology at the Christie Hospital, which is the principal cancer centre in the region. All NHS and private hospitals notify the registry of all cancer cases using a special form. The registry also receives notifications from other regional registries of resident cases treated in hospitals outside the region, and from the ovarian tumour and mesothelioma register. All pathology laboratories in the region submit copies of pathology reports directly to the registry, and the registry receives copies of death certificates for all regional residents whose certificates mention cancer.

INTERPRETING THE RESULTS

A breast screening programme was established for women aged 50–64 years in 1988, and was extended to women aged up to 70 years in 2005. Cervical screening is offered to women aged 25–64 years. A colorectal screening programme for residents aged 60–69 years was initiated in 2006.



USE OF THE DATA

Several reports have been published in which registry data were used to examine variations in cancer incidence and survival within the North West region. Registry data are also used to plan and evaluate cancer services, including the breast and cervical screening programmes. Several national and international research studies have also used the data.

Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on (1) 2010 Small Area Population Estimates provided by the UK Office for National Statistics (ONS) in Titchfield, England, making allowances for births, deaths, and internal and external migration, and (2) aggregated data from lower super output areas (LSOAs) and English cancer registries, supplied by the UK Association of Cancer Registries.

Please note that as of 1 April 2013, this registry is now part of Public Health England.

United Kingdom, England, Northern and Yorkshire

REGISTRATION AREA

The Northern and Yorkshire Cancer Registry and Information Service (NYCRIS) covers an area of approximately 30 000 km^2 that includes the North East region of England and most of the Yorkshire and the Humber region. The population is 6.8 million. The area contains large rural expanses and densely populated urban clusters. Traditional industries include shipping, fishing, textile and clothing manufacture, steel production, shipbuilding, and coal mining.

CANCER CARE FACILITIES

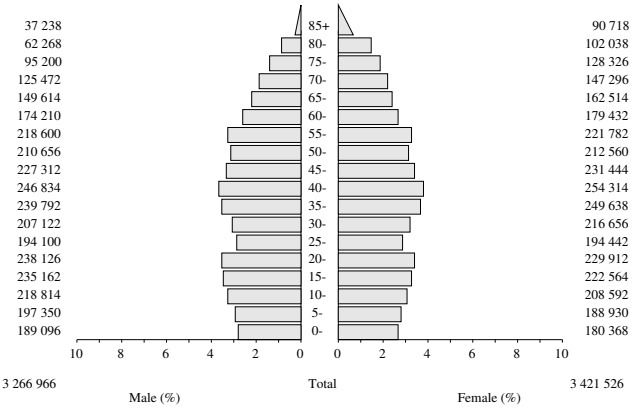
Patients receive care predominantly in National Health Service hospitals. The area has three cancer networks, each with several cancer units and a cancer centre providing integrated services. There are 19 hospital trusts (four serving as major centres providing more specialized services).

REGISTRY STRUCTURE AND METHODS

NYCRIS is based at St James's University Hospital and has about 50 employees (50% involved in data collation and validation, 12% in data management, and 25% in information and research). Notification is mandatory, and hospitals report cases directly to NYCRIS. During the reporting period, this was largely done through paper notifications and manual data collection from case notes. The registry performs extensive quality assurance.

INTERPRETING THE RESULTS

A new registration system was implemented in 2006, but with few changes to the data collection process. A breast screening programme was established for women aged 50–64 years in 1988, and was extended to women aged up to 70 years in 2005. Cervical screening is offered to women aged 25–64 years. A colorectal screening programme for residents aged 60–69 years was initiated in 2006.



USE OF THE DATA

NYCRIS data are used for a variety of purposes, from local audits to national and international research studies. NYCRIS also publishes reports online (http://www.nycris.nhs.uk/).

United Kingdom, England, Oxford Region

REGISTRATION AREA

The Oxford Cancer Intelligence Unit covers the counties of Berkshire, Buckinghamshire, and Oxfordshire (in the South East region of England) and Northamptonshire (in the East Midlands region). In 2001, the proportion of residents describing themselves as White ranged from 89% in Berkshire to 95% in Northamptonshire and Oxfordshire. The proportion describing themselves as Asian ranged from less than 2% in Oxfordshire to nearly 7% in Berkshire. The proportion describing themselves as Black was lowest in Oxfordshire (less than 1%) and highest in Berkshire (2%).

CANCER CARE FACILITIES

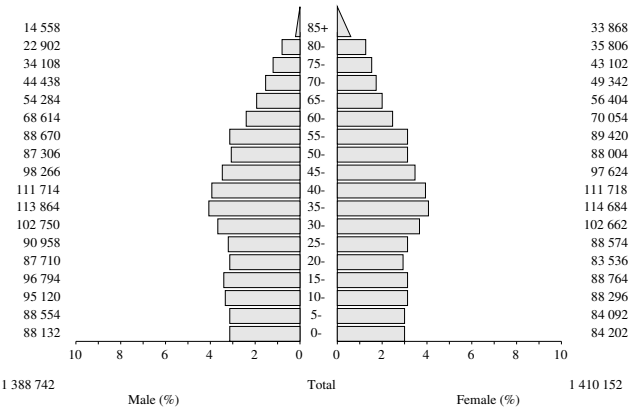
Most patients are treated within the National Health Service. The area has two cancer networks and more than 15 secondary and tertiary care hospitals. Most patients are diagnosed and treated in secondary care hospitals, with referral to tertiary care hospitals for specialized care.

REGISTRY STRUCTURE AND METHODS

The registry regularly downloads information from cancer waiting-time datasets and hospital pathology, oncology, and patient administration systems. Some demographic and clinical information is added to the database automatically. More detailed information (such as pathology diagnosis) is reviewed by clerical officers before being added. Information is also gathered from private hospitals and laboratories, screening programmes, and (for quality assurance purposes) general practitioner and hospital case notes.

INTERPRETING THE RESULTS

A breast screening programme was established for women aged 50–64 years in 1988, and was extended to women aged up to 70 years in 2005. Cervical screening is offered to women aged 25–64 years. A colorectal screening programme for residents aged 60–69 years was initiated in 2006.



USE OF THE DATA

Registry data are used to investigate possible cancer risks in relation to power lines, landfill sites, and mobile phones. Registry data are also used to investigate differences in cancer incidence, survival, and access to treatment between social groups.

United Kingdom, England, South and Western Regions

REGISTRATION AREA

The South West office of the National Cancer Registration Service (formerly the South West Cancer Intelligence Service [SWCIS]) covers the South West region of England, with a total area of about 30 000 km^2. The population of 6.8 million is predominantly White Caucasian, with 60% of residents living in urban areas.

CANCER CARE FACILITIES

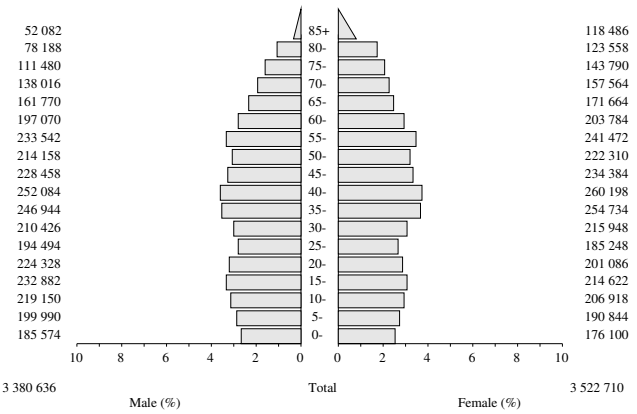
The area has 12 main hospitals, with seven dedicated cancer centres. There are eight regional hospitals with substantial treatment facilities and several small hospitals.

REGISTRY STRUCTURE AND METHODS

The SWCIS was one of eight regional registries in England, funded by the UK Department of Health. It had sites in Bristol and Winchester. The SWCIS had 17 registry staff members, four information analysts, five clinical audit team members, and five network liaison officers. Data were collected from hospital patient administration systems, pathology laboratory reporting systems, multidisciplinary team systems, and the national deaths database. These were accessed via electronic capture and processing, with manual intervention to resolve data conflict. More than 75% of records were captured electronically, usually from more than two independent sources. Coverage was more than 99%.

INTERPRETING THE RESULTS

A breast screening programme was established for women aged 50–64 years in 1988, and was extended to women aged up to 70 years in 2005. Cervical screening is offered to women aged 25–64 years. A colorectal screening programme for residents aged 60–69 years was initiated in 2006. For basal and squamous cell skin cancers, only the first primary diagnosis was registered. Bladder cancer (C67/D41) coding was changed in 2000.



USE OF THE DATA

Registry data are available online and by request. Registry data are regularly used by clinicians, researchers, commissioning and public health bodies, and the media.

REGISTRATION AREA

The Thames Cancer Registry covers London, Surrey, Sussex, and Kent, which together had a total population of about 12 million in 2006.

CANCER CARE FACILITIES

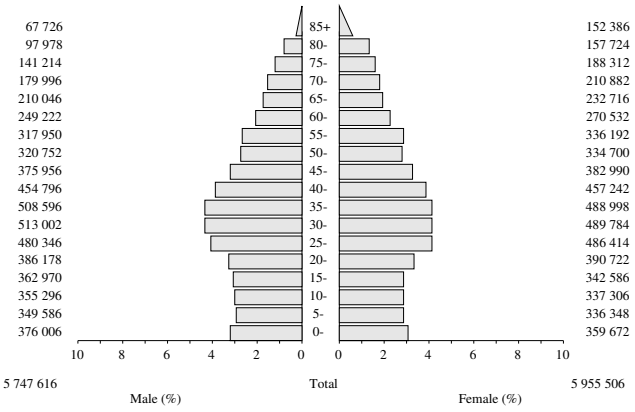
Most cancer patients are treated within the National Health Service (NHS). The registration area has nine cancer networks and more than 50 secondary and tertiary care hospitals. Most patients are diagnosed and treated in secondary care hospitals, and those with rare cancers or requiring specialized care are referred to tertiary care hospitals.

REGISTRY STRUCTURE AND METHODS

The registry is located on the Guy's Hospital campus within the King's College London School of Medicine, and has about 70 employees involved in data abstraction from hospital medical records, data entry, computing, quality assurance, analysis, reporting, research, and management. The main sources of information are pathology reports, hospital patient information systems, medical records, cancer waiting-time datasets, and death certificates. Death certificates are provided electronically (by the UK Office for National Statistics) for registered patients and anyone who dies within the registration area from or with cancer. Cancer is not a reportable disease in the United Kingdom, but the collection of patients' personally identifiable information without direct consent is allowed by a special provision within the NHS Act 2006. Various data validation checks are automatically applied by the registration system, either upon data entry or through daily automated retrospective validation checks and annual patient deduplication. The registry regularly monitors and reports various data and process quality indicators.

INTERPRETING THE RESULTS

A breast screening programme was established for women aged 50–64 years in 1988, and was extended to women aged up to 70 years in 2005. Cervical screening is offered to women aged 25–64 years. A colorectal screening programme for residents aged 60–69 years was initiated in 2006.



USE OF THE DATA

The registry provides a variety of reports to health organizations within the region and contributes data to a national cancer information service (which are then made available online to NHS users). The registry also provides computing expertise for the development of the National Cancer Data Repository and is the lead registry for national work on lung and upper gastrointestinal cancers.

SOURCE OF POPULATION

Based on (1) 2010 Small Area Population Estimates provided by the UK Office for National Statistics (ONS) in Titchfield, England, making allowances for births, deaths, and internal and external migration, and (2) aggregated data from lower super output areas (LSOAs) and English cancer registries, supplied by the UK Association of Cancer Registries.

Please note that as of 1 April 2013, this registry is now part of Public Health England.

United Kingdom, England, Trent

REGISTRATION AREA

The Trent Cancer Registry covers the counties of Derbyshire (except its north-western tip), Leicestershire, Rutland, Lincolnshire, Nottinghamshire, and South Yorkshire, with a total area of 14 763 km^2 and a population of 5.1 million. The overall population profile is similar to that of England as a whole, with similar levels of deprivation. About 75% of residents live in urban areas. The population is about 90.4% White, 5.1% Asian, and 4.5% of other ethnicities.

CANCER CARE FACILITIES

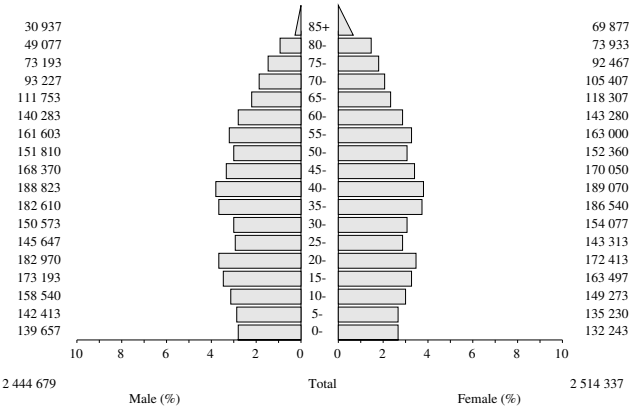
The area has 11 acute trusts, 12 primary care trusts, and three medical schools (in the cities of Leicester, Nottingham, and Sheffield). There are cancer centres providing both radiotherapy and chemotherapy services in Derby, Leicester, Nottingham, and Sheffield. Lincolnshire has a cancer unit with radiotherapy services.

REGISTRY STRUCTURE AND METHODS

Cancer registration in Trent began in 1955 and has undergone several significant changes, including merging with the East Midlands Public Health Observatory in 2005. The registry is funded by the National Health Service and has 36 employees. Data are collected electronically.

INTERPRETING THE RESULTS

A breast screening programme was established for women aged 50–64 years in 1988, and was extended to women aged up to 70 years in 2005. Cervical screening is offered to women aged 25–64 years. A colorectal screening programme for residents aged 60–69 years was initiated in 2006. Male residents have access to the Prostate Cancer Risk Management informed choice programme, through their general practitioners.



USE OF THE DATA

Registry data are used to support the effective provision of cancer services. The registry also contributes to the work of the UK National Cancer Intelligence Network (NCIN) and provides a cancer intelligence service to the East Midlands and North Trent Cancer Networks. Registry data are provided to genetic counselling services, in response to ad hoc requests, and for approved research projects.

Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on (1) 2010 Small Area Population Estimates provided by the UK Office for National Statistics (ONS) in Titchfield, England, making allowances for births, deaths, and internal and external migration, and (2) aggregated data from lower super output areas (LSOAs) and English cancer registries, supplied by the UK Association of Cancer Registries.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Please note that as of 1 April 2013, this registry is now part of Public Health England.

United Kingdom, England, West Midlands

REGISTRATION AREA

The West Midlands Cancer Intelligence Unit (WMCIU) covers the West Midlands region of England, with a population of approximately 5.4 million.

CANCER CARE FACILITIES

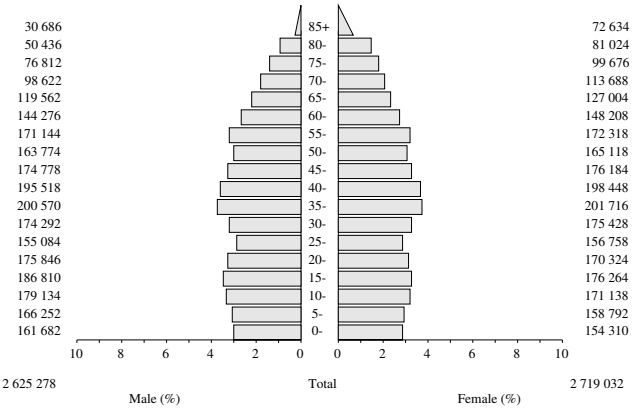
The area has 19 acute trusts and 17 primary care trusts. There are cancer centres providing radiotherapy and chemotherapy services in five major cities.

REGISTRY STRUCTURE AND METHODS

The registry includes records dating back to 1936 and has been population-based since 1957. More than 37 000 new tumours were registered in 2009, and the database holds more than 1.2 million records. Data are acquired from a variety of sources, including hospitals, cancer centres, treatment centres, hospices, screening programmes, other registries, general practices, and death certificates. The WMCIU attempts to register each case from multiple sources to maximize accuracy, and has increased its use of electronic registration data and automated data processing. A preliminary registration is recorded in the WMCIU database within 3 months of data receipt. Full clinical coding takes place within 12 months of the preliminary registration, during which time the registry expects to receive all relevant information. The WMCIU collects a variety of data, including demographics, tumour details, treatment modality information, and death details. The records are clinically coded by experienced registrars trained to UK Association of Cancer Registries standards, who use the internationally recognized ICD-10 topography, ICD-M morphology, and Office of Population Censuses and Surveys Classification of Interventions and Procedures version 4 (OPCS-4) procedure codes. All data entered into the database are subjected to a rigorous quality assurance process.

INTERPRETING THE RESULTS

A breast screening programme was established for women aged 50–64 years in 1988, and was extended to women aged up to 70 years in 2005. Cervical screening is offered to women aged 25–64 years. A colorectal screening programme for residents aged 60–69 years was initiated in 2006.



USE OF THE DATA

The WMCIU is part of the UK National Cancer Intelligence Network, and its regional database is combined with those of other registries to make the UK National Cancer Data Repository.

United Kingdom, Northern Ireland

REGISTRATION AREA

The Northern Ireland Cancer Registry (NICR) covers Northern Ireland, which consists of six counties in the north of the island of Ireland and is part of the United Kingdom. In 2011, the population was 1.8 million. Most of the area is rural, but there are two major urban areas surrounding the cities of Belfast and Londonderry. The population is relatively ethnically homogeneous.

CANCER CARE FACILITIES

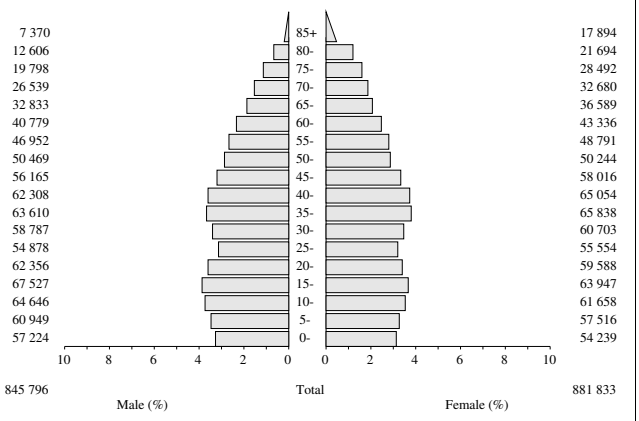
Most cancer patients are treated within the National Health Service and receive care within the region. There are five cancer units, one of which serves as a regional cancer centre and provides radiotherapy. All five provide chemotherapy.

REGISTRY STRUCTURE AND METHODS

The NICR has been operational since 1993. It is located at Queen's University Belfast and funded by the Public Health Agency for Northern Ireland. The NICR uses an automated system and multiple electronic sources, including the patient administration system, histopathology laboratories, and death certificates. Basic registration data are supplemented by a clinical oncology system and information from a multidisciplinary team reporting tool to improve staging and treatment information. Rigorous quality control and quality assurance programmes ensure high levels of completeness and quality. The NICR also abstracts data from hospital records for specific audits to provide a regular check on the data.

INTERPRETING THE RESULTS

A breast screening programme was established for women aged 50–64 years in 1993, and has since been extended to women aged up to 70 years. Population-based cervical screening has been available since the late 1980s. Although prostate-specific antigen (PSA) testing is not used for organized screening, its use has increased since the early 1990s, influencing the incidence of prostate cancer. A colorectal cancer screening programme began in April 2010.



USE OF THE DATA

The registry provides a cancer information service and has been the official provider of cancer incidence and survival statistics for the region since 2012. It exchanges information with cancer screening services for quality assurance purposes. Registry data are routinely used by policy-makers to evaluate and plan services. The registry also provides data to the regional cancer genetics service.

Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on the 2001 census (http://www.nisra.gov.uk/census/2001Census.html), with annual estimates making allowances for births, deaths, and migration.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

United Kingdom, Scotland

REGISTRATION AREA

The Scottish Cancer Registry covers Scotland, which is part of the United Kingdom and has a population of slightly more than 5 million. Most residents live within an industrialized belt across the centre of the country; the rest live in more sparsely populated areas to the north and south. In 2001, about 88% of residents classified themselves as White Scottish, about 10% as Other White, and about 2% as members of minority ethnic populations.

CANCER CARE FACILITIES

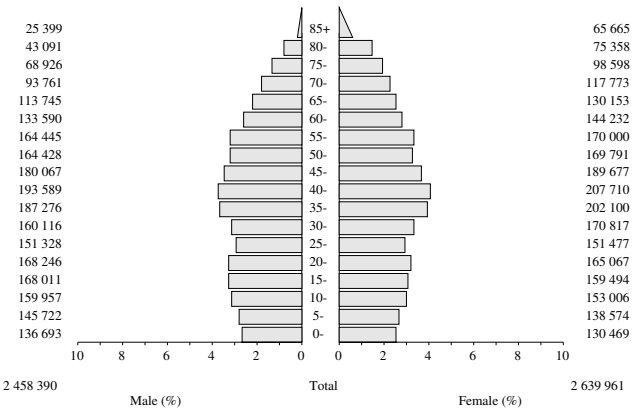
The National Health Service (NHS) is funded mainly through taxation and is mostly free at the point of use. Access to hospital care is controlled by primary care providers. Radiotherapy is available at five main centres, but many cancer patients are diagnosed and receive primary therapy at district general hospitals. The private health care sector in Scotland is relatively small.

REGISTRY STRUCTURE AND METHODS

The registry is part of the Information Services Division of National Services Scotland (which is part of the NHS) and is funded by the Scottish government. Cancer is not a reportable disease in Scotland. Potential registrations are identified from four main electronic sources: hospital discharge records, oncology records, pathology records, and death records. Information from these and other sources is linked to create provisional registrations, which are then validated by registry staff members through consultation of medical records. The staff members also abstract additional information that cannot be collected electronically.

INTERPRETING THE RESULTS

The registry adopted ICD-10 and ICD-O-2 for coding cases diagnosed as of 1 January 1997, and ICD-O-3 was adopted for cases diagnosed as of 1 January 2006. There is a comparatively high prevalence of risk factors for cancer in Scotland. There are screening programmes for cervical, breast, and colorectal cancers. The prostate-specific antigen (PSA) test was introduced in Scotland in 1989, although screening for prostate cancer is not currently recommended.



USE OF THE DATA

The registry regularly publishes incidence data and periodically publishes survival data. Registry data are used to support a wide variety of activities, including research. Further information is available from http://www.isdscotland.org/Health-Topics/Cancer/Scottish-Cancer-Registry.asp.

† See note following population pyramid

United Kingdom, Wales

REGISTRATION AREA

The Welsh Cancer Intelligence and Surveillance Unit (WCISU) covers Wales, which is part of the United Kingdom and has an area of nearly 20 800 km^2. In 2007, the population was almost 3 million. Much of Wales is rural and mountainous, but two thirds of residents live in urban South Wales.

CANCER CARE FACILITIES

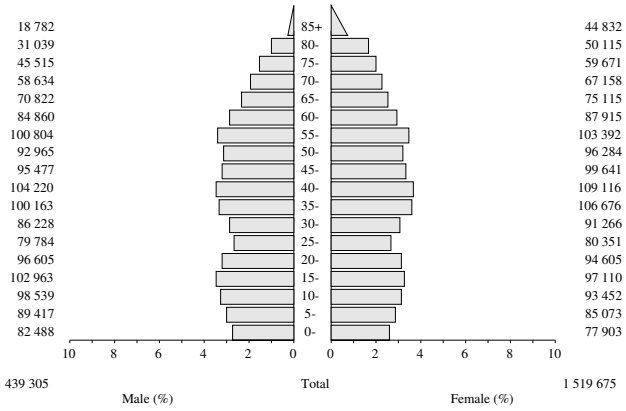
Wales has seven health boards. Although health services are devolved to the Welsh government, most patients are diagnosed and treated within the National Health Service (NHS), which is free at the point of use. Two cancer networks and a system of multidisciplinary teams and site-specific clinical groups are coordinated by the Cancer National Specialist Advisory Group, which advises the Welsh government on the strategic development of effective evidence-based cancer services.

REGISTRY STRUCTURE AND METHODS

The WCISU was established in 1997 to provide information on cancer in Wales, and is an organization within the Public Health Wales NHS Trust. The registry is located in the city of Cardiff and is funded through a programme-level agreement between the Welsh government and Public Health Wales. The WCISU is staffed by 23 employees. The main sources of information are hospital inpatient records, pathology reports, death certificates, and registration from other cancer registries (for resident cases diagnosed and/or treated outside Wales). The WCISU also receives data from multidisciplinary teams. Each year, the data on several cancer types are validated throughout Wales and the data on a random sample of 10% of all patients are validated at hospitals.

INTERPRETING THE RESULTS

Wales has organized screening programmes for breast, cervical, and colorectal cancers, and the registry exchanges data with each of these programmes. Changes to the coding of bladder cancer as per the UK Association of Cancer Registries guidelines occurred in 2007, and some malignant cancers are now registered as in situ.



USE OF THE DATA

The WCISU publishes a variety of reports each year. The registry also provides a request and analysis service to organizations and individuals who require cancer information, and provides information to support genetic counselling services.

Australian Capital Territory

REGISTRATION AREA

The Australian Capital Territory (ACT) Cancer Registry covers the population of the ACT, which has an area of approximately 2400 km^2 and is surrounded on all sides by the state of New South Wales (NSW). Almost all ACT residents live in metropolitan Canberra. At the June 2006 census, the estimated population of the ACT was 334 000, of whom 18.7% were aged less than 15 years and 9.5% were aged 65 years or more. The ACT population accounts for 1.6% of Australia's total population.

CANCER CARE FACILITIES

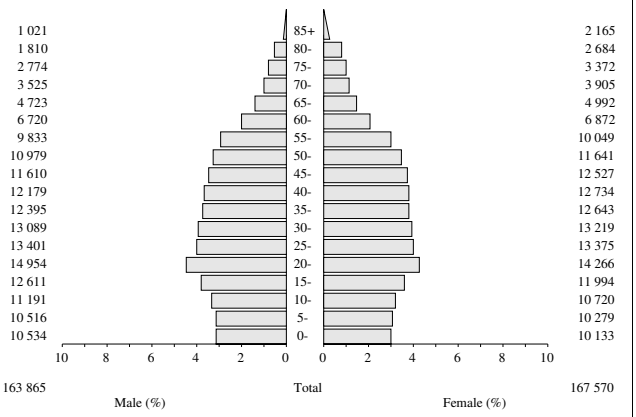
The ACT Government Health Directorate oversees general health care in the region, in partnership with the service providers. The ACT has a comprehensive range of cancer prevention, early detection, treatment, community care, and palliative services available to the local community, in both the public and private sectors. Canberra Hospital is the principal cancer care provider in the ACT and surrounding NSW region, and offers expertise in surgery, medical and radiation oncology, and haematology services.

REGISTRY STRUCTURE AND METHODS

The ACT Cancer Registry collects data on all new cases of cancer and cancer-related deaths among ACT residents. The ACT Government Health Directorate funds the registry. All public and private pathology laboratories, hospitals, and nursing homes in the ACT are required by law to notify the registry of any cancer in patients or in human tissues. The notification of cancer became mandatory in the ACT in 1994, under provisions of the Public Health Act. Before that, notification had been voluntary since 1982. The Health Directorate contracts the Cancer Institute NSW to register ACT cancer cases and cancer-related deaths on its behalf.

INTERPRETING THE RESULTS

Until 1994, the voluntary nature of reporting led to underreporting of cancer cases. Due to the implementation of mandatory notification, the level of ascertainment is now likely to be high. Screening programmes exist for breast cancer (among women aged 50–69 years, with estimated 57% coverage), cervical cancer (among women aged 18–69 years, with 62% coverage), and colorectal cancer (among individuals aged 50–65 years).



USE OF THE DATA

The registry monitors cancer incidence trends within the ACT population. Due to the small number of cases registered each year, data are reported as 5-year averages on a biennial reporting cycle. Unit record data are available to approved medical researchers engaged in studies that are considered to be of benefit to the community by the ACT Health Human Research Ethics Committee.

Australia, New South Wales

REGISTRATION AREA

The New South Wales (NSW) Central Cancer Registry, which covers the state of NSW, was created in 1972. At the 2011 census, the NSW population was 6.9 million; Sydney is the state's most populous city (4.4 million). The state's other residents live in coastal towns and rural/remote areas. NSW has the country's largest Aboriginal population (172 000), accounting for 31.5% of all Aboriginal Australian residents. There is also a large migrant population (27%), predominantly from the United Kingdom, New Zealand, and Europe, and increasingly from Asia. A total of 61% of Australian residents self-identify as Christian, 22% as atheist or undeclared, and less than 3% each as Eastern Orthodox, Buddhist, Muslim, and Hindu.

CANCER CARE FACILITIES

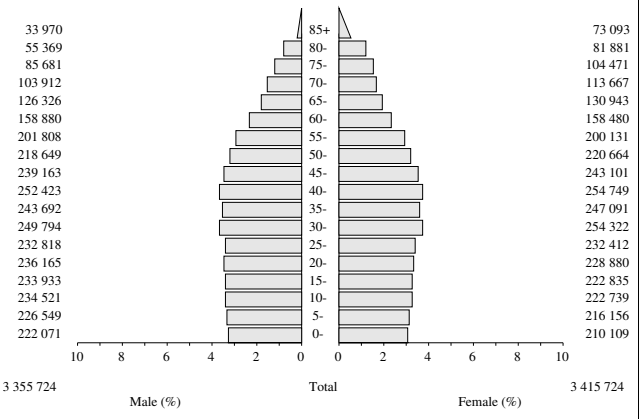
Local health districts provide local cancer services, including inpatient and outpatient hospital care and community health care, and specialist cancer care centres provide outpatient radiotherapy and chemotherapy services. Cancer services are also provided by private facilities.

REGISTRY STRUCTURE AND METHODS

The NSW Central Cancer Registry is managed and funded by the Cancer Institute NSW on behalf of the Ministry of Health. The registry records all cases of invasive cancer, excluding non-melanoma skin cancers. Notification of cancer is mandatory for all NSW facilities that diagnose or treat cancer (as per the Public Health Act 1991). Approximately 50% of all notifications are electronic, and pathology reports are paper-based. The collected information is protected by the Public Health Act and kept confidential. Death registrations are provided by the Australian Bureau of Statistics, and the registry routinely matches cancer cases against records of all deaths in Australia to update follow-up information. A consolidated population and clinical cancer registry database is currently being built.

INTERPRETING THE RESULTS

NSW has screening programmes for breast cancer (among women aged 50–69 years, with estimated 56% coverage) and cervical cancer (among women aged 20–69 years, with 60% coverage), which were both started in 1991.



USE OF THE DATA

The registry contributes to prevention programmes, planning, cancer control, and evaluation of screening programmes in NSW by providing timely and accurate data. An annual statistical report and tabulated data are made available through a web-based reporting module, and several other reports are available from the Cancer Institute NSW's website (http://www.cancerinstitute.org.au/). The registry also contributes to national and international publications. Unit record information is provided subject to approval from the registry's Research Ethics Committee.

SOURCE OF POPULATION

Obtained from the Australian Bureau of Statistics. The estimated resident population of NSW in 2005 is based on intercensal estimates. Population estimates are adjusted on the basis of births, deaths, and migrations. Updated population estimates are released every year in June and December.

Australia, Northern Territory

REGISTRATION AREA

The Northern Territory Cancer Registry (NTCR) is a population-based registry established in 1981 to cover the entire population of the Northern Territory (NT), a sparsely settled area of 1.4 million km^2 in central and northern Australia. At the June 2011 census, the estimated population of the NT was 231 000. Approximately 30% of residents are Indigenous Australians, many of whom live in small, remote communities.

CANCER CARE FACILITIES

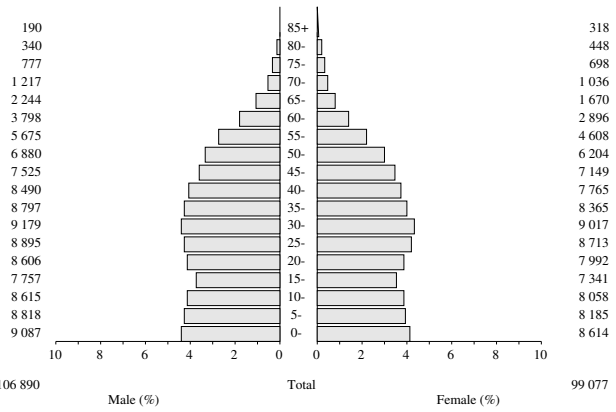
There are six hospitals (including two referral hospitals) and a well-developed private health care system in the larger towns. There is also an extensive network of primary health care centres in the more remote communities. The NT has significantly strengthened its Cancer Service in the past few years, with the opening of the Alan Walker Cancer Care Centre (AWCCC) in 2010. The AWCCC provides the latest radiation and chemotherapy treatments available, reducing the need for lengthy interstate travel for the majority of cancer patients.

REGISTRY STRUCTURE AND METHODS

The registry is located within the Health Gains Planning Branch of the state's Department of Health. Notification of NT cancer cases is mandatory for all NT hospitals and pathology laboratories, as well as for the Registry of Births, Deaths and Marriages, as per the Cancer (Registration) Act 2009. General practitioners and other health professionals are not required to notify but must provide information upon request. Data processing, coding, and database maintenance are performed under contract by the South Australian Cancer Registry. Data analysis and publication are performed by the Health Gains Planning Branch staff. No clinical data are collected, although there are plans to establish a clinical prostate cancer registry.

INTERPRETING THE RESULTS

Cancer incidence and mortality statistics are published separately for Indigenous and non-Indigenous residents. Indigenous Territorians have a very different pattern of cancer incidence and survival for specific cancer sites than do other Australians; incidence is much higher for some cancers and lower for others, and cancer survival is lower in general. Screening programmes exist for breast cancer (among women aged 50–69 years, with estimated 42% coverage) and cervical cancer (among women aged 20–69 years, with 56% coverage).



USE OF THE DATA

Due to the small number of cases registered each year, the registry produces statistical reports only every few years. In recent years, registry data provided invaluable information for determining the feasibility of establishing a radiation oncology service within the NT.

SOURCE OF POPULATION

Based on the 2006 national Census of Population and Housing carried out by the Australian Bureau of Statistics. The net undercount rate for the NT Indigenous population in this census was 19.2% (*3101.0 - Australian Demographic Statistics*, Mar 2007).

Australia, Queensland

REGISTRATION AREA

The Queensland Cancer Registry (QCR) was established on 1 January 1982 and collects data relevant to the state of Queensland, which occupies the north-eastern portion of the Australian continent. Queensland is the second largest of the six Australian states and has a subtropical to tropical climate. The state has the second fastest growing population in the country. At the 2006 census, the Queensland population was 3.9 million, representing 19% of the overall Australian population. Torres Strait Islanders and other Aboriginal Australians represent approximately 3.3% of the state's overall population.

CANCER CARE FACILITIES

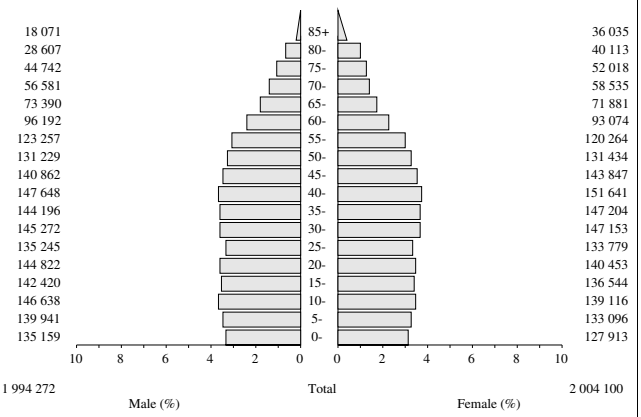
Specialist cancer treatment is provided primarily by the major Brisbane hospitals, both public and private, and large regional hospitals also provide specialized treatment. In addition, some oncology specialists visit patients at regional centres. Radium treatment is available at 12 private and public facilities throughout the state.

REGISTRY STRUCTURE AND METHODS

The registry is located at the Cancer Council Queensland and is funded by the Queensland Department of Health. It has a core staff of 14 permanent employees, supported by additional temporary employees. The registry operates under an Act of Parliament that requires mandatory notification of all cancer cases in Queensland by all hospitals (public, private, and psychiatric), nursing homes, and pathology laboratories. Death certificates are accessed when the cause of death is cancer, and also for patients dying of other causes. All releases of registry data strictly adhere to the governing legislation regarding privacy and confidentiality.

INTERPRETING THE RESULTS

Initiatives undertaken recently include the expansion of facilities providing notifications electronically and the introduction of a scanned record system, both of which have helped increase the quality of data provided. Screening programmes exist for breast cancer (among women aged 50–69 years, with estimated 58% coverage), cervical cancer (among women aged 20–69 years, with 58% coverage), and – since 2006 – colorectal cancer (among individuals aged 50–65 years).



USE OF THE DATA

The registry's purpose is to collect data that describe the nature and extent of cancer in Queensland. The QCR does not perform research itself, but it does provide data to researchers undertaking approved epidemiological studies. Policy-makers also use registry data for planning and evaluating health services. QCR data are released annually in the publication *Cancer in Queensland – Incidence, Mortality, Survival and Prevalence*, and are submitted to national bodies for Australia-wide statistical publication and analysis.

South Australia

REGISTRATION AREA

The South Australian Cancer Registry (SACR) provides population-based statistics on cancer incidence, mortality, and case fatality (survival) for the residents of the state of South Australia (SA), which has a population of 1.6 million. Data from the registry, the second oldest in the country, are now available for the diagnostic period of 1977–2009. The registry's objectives are to document all new cases of invasive cancer diagnosed in SA and to track their progress.

CANCER CARE FACILITIES

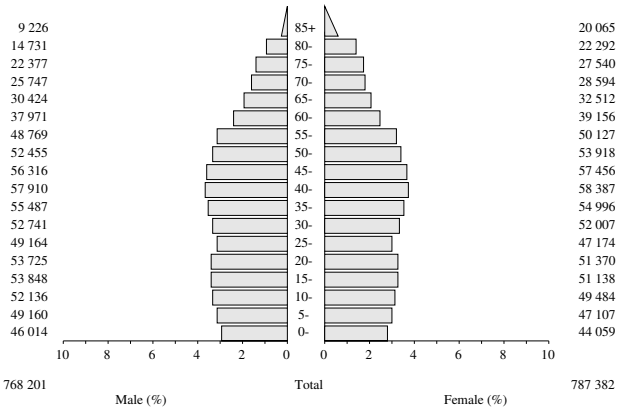
Cancer diagnostic and treatment services in SA are covered for all citizens and permanent residents by Medicare Australia, the publicly funded national health insurance system. Supplemental private medical insurance is also available to those who wish to increase their care options. Care is provided by both public and private hospitals and clinics. General practitioners are privately employed; some charge patients an out-of-pocket fee, while others do not.

REGISTRY STRUCTURE AND METHODS

The SACR collects a minimum dataset for each cancer case, including elements such as place of residence, sex, date of birth, date of diagnosis, cancer site and morphology, means of diagnosis, whether there were multiple primary sites of cancer, race, and country of birth. When applicable, the registry also records date, place, and cause of death. The registry's primary sources of information include pathology laboratories, hospitals, radiotherapy departments, and the Registrar of Births, Deaths and Marriages. Notification by these sources is mandated by the SA cancer regulations.

INTERPRETING THE RESULTS

Although melanomas and in situ cancers of the bladder and female breast are included in data collection, they are excluded from the annual local report. A screening programme exists for breast cancer (among women aged 50–69 years).



USE OF THE DATA

Registry data are used in cancer control planning and in planning prevention, screening, treatment, rehabilitation, hospice, and palliative care programmes, as well as to monitor and evaluate the impact of these programmes. SACR data enable the surveillance of trends in cancer incidence, mortality, and survival by cancer site and by age, sex, geographical area of residence, and diagnostic period. Continuous monitoring permits prompt response to public concerns about clusters of cancers and regional increases in incidence.

CONTRIBUTOR

Ron Somers

South Australia (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on the 2000 national census, making allowances for births and deaths. It was not possible to estimate migration into and out of the registration area.

Australia, Tasmania

REGISTRATION AREA

The Tasmanian Cancer Registry (TCR) covers the population of Tasmania, Australia's smallest state. The state consists of a group of islands with a total area of 68 114 km^2, which have a temperate climate. Of the total Tasmanian population, 72% of residents live in urban areas, 11% were born outside of Australia, 3% are of Indigenous origin, and 15% are aged 65 years or more.

CANCER CARE FACILITIES

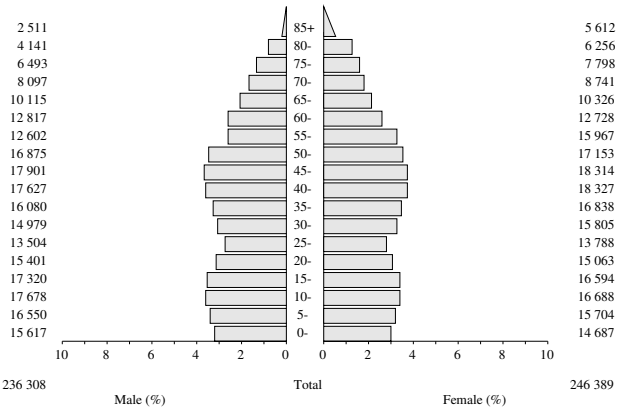
Each of Tasmania's three main population regions has a public hospital system and several private hospitals. There are two radiation oncology units in the state.

REGISTRY STRUCTURE AND METHODS

The TCR was established in 1977. In July 1988, the responsibility for its operation and funding was transferred from the Department of Health and Human Services (DHHS) to the Menzies Research Institute Tasmania of the University of Tasmania, in Hobart. Cancer was proclaimed a reportable disease in Tasmania in December 1992, giving cancer registration a legislative basis. The TCR staff currently consists of a director, a manager, two full-time medical coders, one part-time medical coder, and an administrative assistant. Reports of cancer are received from all pathology service providers in the state, the two radiation oncology clinics, and private and public hospitals. Death certificates are reviewed for mention of cancer. When information received is insufficient for complete registration, active follow-up is undertaken by contacting the treating doctors, pathology laboratories, and hospital medical records departments as necessary.

INTERPRETING THE RESULTS

In the 1990s, an increase in the incidence of prostate cancer coincided with the increased use of prostate-specific antigen (PSA) testing. The incidence peaked in 1995 before declining. Before 2000, cancer cases were not accepted by the registry on the basis of a death certificate alone. Screening programmes exist for breast cancer (among women aged 50–69 years, with estimated 70% coverage), cervical cancer (among women aged 18–69 years, with 63% coverage), and – since 2006 – colorectal cancer (among individuals aged 50–65 years).



USE OF THE DATA

The registry publishes an annual morbidity and mortality report, and contributes to national reporting. The DHHS receives detailed data annually, and regular data exchange occurs between the registry and specified cancer screening programmes. Researcher requests for summary data and unit record data (both anonymized and identified) are granted subject to the appropriate ethical approval.

CONTRIBUTORS

Alison Venn
Marita Dalton

Australia, Tasmania (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on the estimated resident population on 30 June of each year, as published by the Australian Bureau of Statistics.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Australia, Victoria

REGISTRATION AREA

The Victorian Cancer Registry (VCR) covers Victoria, the second most populous state in Australia. Three quarters of Victoria's residents live in the greater metropolitan area of Melbourne. At the 2006 census, 26% of residents were described as being born overseas; 30% of migrants were from Asia, 21% from southern Europe, and 18% from the United Kingdom.

CANCER CARE FACILITIES

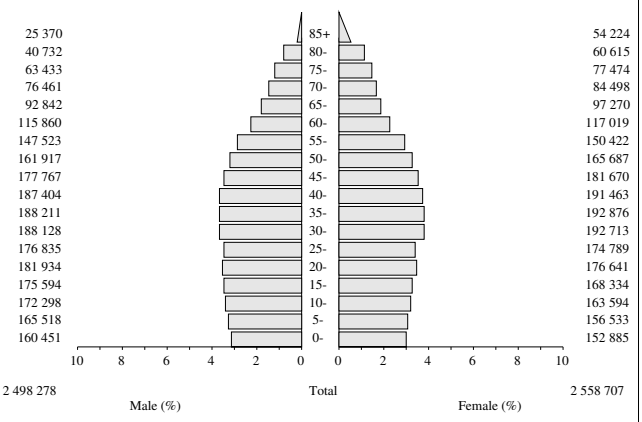
Victoria's medical care system is a mix of the private and public sectors, but the bulk of cancer management is carried out within the private sector. There are four public and one private radiation oncology facilities in the state, some with multiple campuses.

REGISTRY STRUCTURE AND METHODS

The VCR operates within the legal framework of the Cancer Act, Health Records Act, and Public Records Act, which, respectively, cover mandatory reporting, release of information, and retention of records. The registry is located within the Cancer Council Victoria and has a staff of about 25 employees, including medical coders, an operations manager, electronic notifications and training officers, a director, an information manager, and administrative support staff members. About 80% of notifications are received electronically from 250 public and private hospitals and 50 pathology laboratories statewide, and more than 100 000 cancer notifications are processed in the preparation of each year's data. The VCR follows IACR recommendations for case definition and coding. Data quality is assured by matching pathology reports with hospital registrations for cases in which diagnosis was based on histological confirmation.

INTERPRETING THE RESULTS

Due to its low latitude and highly susceptible population, Victoria has a high incidence of skin cancers. Other cancer risk factors that are predominant in the state include smoking (which is declining) and obesity (which is becoming more prevalent). Prostate cancer incidence has risen dramatically since the early 1990s due to ad hoc screening by prostate-specific antigen (PSA) testing. Screening programmes exist for breast cancer (among women aged 50–69 years) and cervical cancer (among women aged 18–69 years).



USE OF THE DATA

The registry produces regular statistical reports to monitor the cancer epidemic and compare trends, particularly for cancers targeted by prevention programmes (such as cancers of the skin, lung, breast, and cervix). Another important function of the registry is to facilitate epidemiological research, for example by helping researchers to perform follow-up of cancer events in cohort studies and to identify cases for case–control studies. Registry information is a key component of the Cancer Council's cancer control programmes.

Western Australia

REGISTRATION AREA

The population-based Western Australian Cancer Registry (WACR) began operating in 1981. It covers the state of Western Australia, which has a population of approximately 2 million. Approximately 3% of residents are Aboriginal Australians, whose average life expectancy is 15–20 years less than that of non-Aboriginal Australians.

CANCER CARE FACILITIES

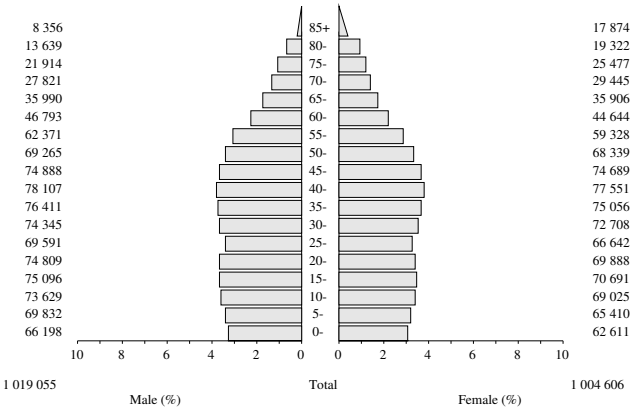
Cancer therapy services are concentrated in the Perth Metropolitan Area, in the major (government-operated) teaching hospitals, and in several private clinics acting as referral centres for rural areas. The large geographical area of the state and the consequent difficulties in providing access to treatment and other support services in rural areas continue to demand significant expenditure within the health sector.

REGISTRY STRUCTURE AND METHODS

The registry is staffed by a small, dedicated team of seven long-serving employees with 150 years of combined experience in the area. Under state legislation, notification of cancer by pathologists is compulsory. Other notification sources include hospitals, radiation oncologists, and some clinicians. The registry works closely with a health and mortality data linkage unit and has coded mortality outcomes since 1990. For death-certificate-only (DCO) cases, unknown primary site cases, and uncorroborated hospital-coded cancer-related discharges, follow-up is undertaken with hospitals and clinicians as provided for in the legislation. Breast and cervical cytology registers are also useful sources of information. The legislation also provides for the exchange of data with other Australian registries, as well as the supply of information to treating clinicians as needed. The state's complete cancer notification regulations are available from http://www.health.wa.gov.au/wacr/home/regulations.cfm.

INTERPRETING THE RESULTS

The definition of neoplasms has been broadened to include in situ malignancies and some borderline and benign tumours. Primary basal cell carcinoma and squamous cell carcinoma skin cancers are not reportable but are included in mortality data. Screening programmes exist for breast cancer (among women aged 50–69 years, with estimated 59% coverage) and cervical cancer (among women aged 20–69 years, with 58% coverage).



USE OF THE DATA

The registry produces annual reports of incidence data, which are available from http://www.health.wa.gov.au/wacr/statistics/stats_full.cfm.

New Zealand

REGISTRATION AREA

The New Zealand Cancer Registry (NZCR) covers the country of New Zealand, which is situated in the South Pacific Ocean, 1600 km south-east of Australia. Its total land area is 270 534 km^2. At the 2006 census, approximately 86% of New Zealand's residents lived in urban areas. Of the total population, 67.6% of New Zealanders self-identified as European and 14.6% as Maori. The other main ethnic groups were Asians (9.2%) and Pacific Islanders (6.9%).

CANCER CARE FACILITIES

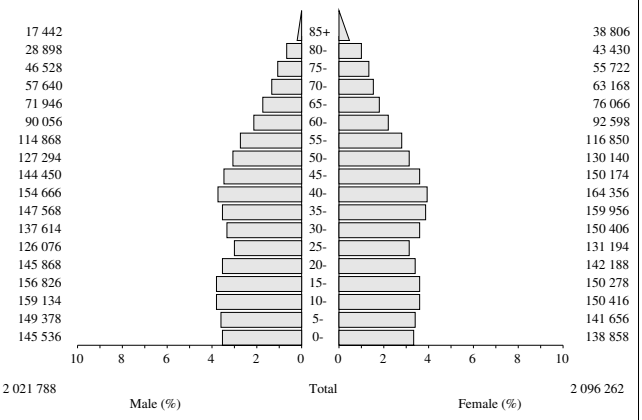
Cancer care in New Zealand is predominantly state-funded, supplemented by private hospitals and private practitioners. There are six major cancer treatment facilities, located in the main population centres.

REGISTRY STRUCTURE AND METHODS

The NZCR is located within the New Zealand Ministry of Health in Wellington and has been in operation since 1948. The registry is staffed by seven clinical coders and two support staff members. Since 1994, laboratories have been the primary source of cancer notifications to NZCR. Laboratories are required by law to report any new diagnosis of cancer in New Zealand, excluding basal and squamous cell skin cancers. Additional data sources include medical certificates of causes of death, coroners' findings, and public and private hospital discharge data received electronically. All cancer registrations are coded by registry staff members. Quality control procedures include computerized validation checks at data input and rigorous edit checks of prepublication incidence data.

INTERPRETING THE RESULTS

The NZCR adopted ICD-O-3 for the coding of cancers diagnosed from January 2003 onwards. This resulted in changes to the coding of some cancers, particularly haematological malignancies, which may have affected incidence reporting for some cancer sites. As of January 2005, superficial transitional cell carcinoma of the bladder is no longer coded as an invasive cancer, resulting in a decrease in the number of bladder cancer registrations. Screening programmes exist for breast cancer (among women aged 45–69 years) and cervical cancer (among women aged 20–69 years).



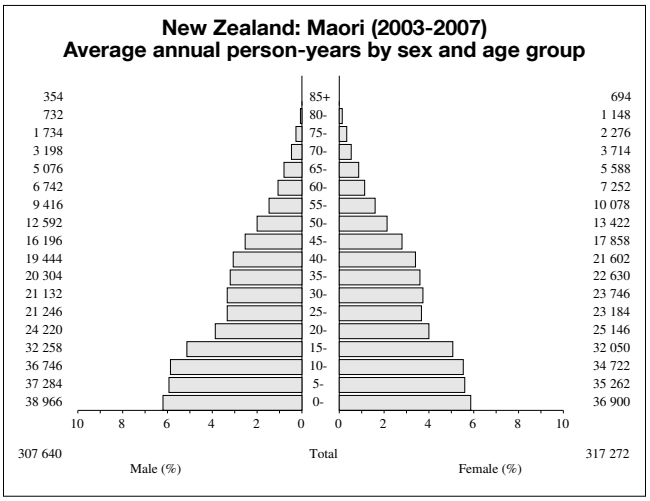
USE OF THE DATA

The NZCR provides data for public health research, policy formulation, monitoring of screening programmes, and cancer incidence and survival studies. The Ministry of Health also uses the registry data to produce an annual cancer publication containing information about cancer incidence and trends.

CONTRIBUTOR

Susan Hanna

New Zealand (2003-2007)
Average annual person-years by sex and age group



SOURCE OF POPULATION

The total and Maori populations are the estimated resident annual populations obtained from Statistics New Zealand. Note that there was a significant definitional change in ethnicity in New Zealand mortality data in 1995. The Pacific Islander population is based on projected population data supplied by Statistics New Zealand. The Other (non-Maori, non-Pacific-Islander) population was calculated by subtracting the Maori and Pacific Islander populations from the total population.

REGISTRATION AREA

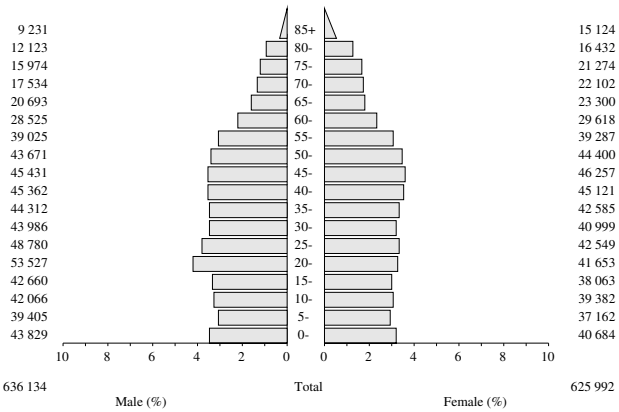
The Hawaii Tumor Registry (HTR) is an active surveillance monitoring system for the entire United States state of Hawaii, which consists of eight major and 124 minor islands, spanning 1367 miles from tip to tip. At the 2005 census, Hawaii's population was approximately 128 000, with the majority of residents living on the island of Oahu.

REGISTRY STRUCTURE AND METHODS

The HTR was established in 1960 and became a founding member of the United States National Cancer Institute's SEER Program in 1973. As the central statewide collection point for cancer data, the HTR receives data from collaborating hospitals maintaining their own hospital-based tumour registries. HTR employees also gather data from oncology clinics, pathology laboratories, private physicians, radiation oncology facilities, and other facilities. The HTR collects the required SEER demographic and diagnostic information for all malignancies diagnosed in the state. Patients are followed up annually throughout their lifetimes. To ensure accuracy, strict quality control and quality assurance procedures have been established.

INTERPRETING THE RESULTS

The HTR data collected for the diagnosis years of 1973 onward are complete. There are some differences in incidence rates between males and females, and among several ethnic groups. Hawaii is unique in that its population is racially diverse, with no one ethnicity in the majority. Screening programmes exist for breast, cervical, colorectal, and prostate cancers.



USE OF THE DATA

The HTR maintains a database of information on all cases of cancer diagnosed in the state of Hawaii, which is a major source of cancer data and information locally, nationally, and internationally. The registry provides complete cancer reporting for the entire state and serves as a resource for nearly all epidemiological cancer research and cancer control activities in Hawaii. Hawaiian statistics on a wide variety of malignancies are available to the research community worldwide. The most recent version of the statistical publication *Hawaii Cancer Facts & Figures* is available for download from http://www.uhcancercenter.org/research/research-highlightsreports. The publication provides an overview of cancer; a discussion of the impact of sex, age, and racial/ethnic disparities on cancer; and an analysis of the six major cancer sites.

SOURCE OF POPULATION

Overall population estimates, including intercensal estimates, are based on the 2000 national census carried out by the United States Census Bureau. Race/ethnicity-specific population estimates are also based on data from the 2000 national census, adjusted for population shifts in intercensal years using data from the state of Hawaii and national census sources.
