INTERNATIONAL AGENCY FOR RESEARCH ON CANCER

The International Agency for Research on Cancer (IARC) was established in 1965 by the World Health Assembly, as an independently financed organization within the framework of the World Health Organization (WHO). The headquarters of the Agency are in Lyon, France.

The Agency conducts a programme of research concentrating particularly on the epidemiology of cancer and the study of potential carcinogens in the human environment. Its epidemiological studies are supplemented by studies of the mechanisms of carcinogenesis carried out in the Agency's laboratories in Lyon. The promotion of collaborative research among scientists worldwide is a strong feature of the Agency's activities. The Agency also conducts a programme for the education and training of personnel for cancer research.

The publications of the Agency are intended to contribute to the dissemination of authoritative information on various aspects of cancer research. Information about IARC publications and how to order them is available online at http://publications.iarc.fr/.

INTERNATIONAL ASSOCIATION OF CANCER REGISTRIES

The International Association of Cancer Registries (IACR) was created following the Ninth International Cancer Congress, held in Tokyo, Japan, in 1966. The Association is a voluntary nongovernmental organization in official relations with WHO, representing the scientific and professional interests of cancer registries, with members interested in the development of cancer registration and its application to studies of well-defined populations.

There are currently more than 700 member registries in IACR, along with an elected executive board. Since 1973, IARC has provided the secretariat for the Association with the primary functions of organizing meetings and coordinating scientific studies. Information about the Association, including membership, activities, and publications, is available online at http://www.iacr.com.fr/.

Foreword

National cancer control planning must still depend too often on unreliable estimates of cancer burden: estimates based on incomplete data, old data, or in some cases no data at all. The International Agency for Research on Cancer (IARC) is committed to supporting and strengthening cancer registries, particularly in low- and middle-income countries, to address this gap. In this context, the cancer registries included in *Cancer Incidence in Five Continents* (CI5) collectively illustrate, perhaps better than anywhere else, the full value of establishing and sustaining high-quality population-based cancer registration. Inclusion in the CI5 series has long been considered an international quality standard for cancer registries around the world. Lack of inclusion should not detract, however, from the remarkable efforts and progress being made by the cancer registries not (yet) included in the series. Rather, this volume should provide encouragement and inspiration, as a testament to what can be achieved and how.

It is good news that the value of cancer registration is increasingly being recognized by policy-makers, not least because of the emphasis on cancer along with other noncommunicable diseases (NCDs) at the highest political level. Furthermore, WHO Member States have agreed to measure "cancer incidence, by type of cancer, per 100 000 population" as an indicator in the NCD Global Monitoring Framework. The ability to analyse cancer trends over time enables better planning for changing patterns of cancer at the national level. This is another advantage that the high-quality cancer registries in CI5 bring to cancer control planning. Additional modelling, for example of the proportion of cancers attributable to various causes or the potential benefits of interventions to reduce cancer burden, requires a foundation of reliable cancer registry data, and such requirements will only increase.

Cancer registrars are a remarkable breed. In my current post I have had the privilege of visiting several cancer registries around the world and without fail I am struck by the passion, tenacity, dedication, and determination of those who believe in the value of their work. In turn, I have been able to prioritize this area of work at the Agency, so that we may contribute our own part to the provision of reliable global cancer statistics.

Work on CI5 was one of the first activities undertaken by the Agency when it was founded nearly 50 years ago, and the series is a good example of the collaborative work that continues to characterize IARC's approach today. Each volume is created in collaboration with individual cancer registries, and also with the valued and vital collaboration of the International Association of Cancer Registries (IACR). CI5 Volume X differs from its predecessors in several ways, and among these changes is the increase in the number of registries and populations included. Despite positive signs, however, this volume also illustrates once again just how far we still have left to go in increasing the coverage of populations, particularly in low- and middle-income countries. And this sets us our challenge: to see Volume XI burgeoning with new registries, joining those already well established. In achieving this goal, we will have provided a vital resource to global efforts to tackle the cancer problem and ultimately to see the number of registries go up while the rates they report go down.

Chapter 1: Introduction

David Forman, David H. Brewster, Betsy Kohler, and Marion Piñeros

The main objective of the *Cancer Incidence in Five Continents* (CI5) series, published by the International Agency for Research on Cancer (IARC) and the International Association of Cancer Registries (IACR), is to present comparable data on cancer incidence for all countries around the world for which high-quality data have been made available by population-based cancer registries. This new volume of CI5 (Volume X) provides information about cancers diagnosed during the period from 2003 to 2007. Every effort has been made to ensure that the information included in this volume can be used with confidence to compare geographical patterns and – by comparison with data from earlier volumes – temporal trends in cancer. In CI5 Volume I, which was published in 1966 and reported on cancer incidence in the early 1960s, it was stated that "the most valuable data are, undoubtedly, the rates obtained by recording the occurrence of every case of cancer in a defined community over a specified period." Such recording remains the core task of cancer registries today, and it is the function of CI5 to report their results using a common format.

CALL FOR DATA

For CI5 Volume X, a call for data and an accompanying questionnaire were sent to all population-based cancer registries that were members of IACR in September 2011. The call for data and the questionnaire were also published on the IACR website, with both documents available in English, French, and Spanish. Registries that wished to submit datasets for Volume X were requested to do so using the IARC portal (see Chapter 6) – a new feature for this volume – and the questionnaire was available for completion online. Detailed instructions for preparing the registry dataset and the accompanying mortality and population information were provided in the call for data. In some countries, registries delegated data submission to their national associations or networks, but each registry was required to submit its own responses to the questionnaire.

Although the reference time period for Volume X was defined as 2003–2007, contributors were also asked to send data for years before and (if available) after the reference period, to allow the volume editors to verify certain aspects of quality, comparability, and completeness for each submission. Not all registries were able to provide data for the whole time period covered by Volume X, but a minimum consecutive series of 3 years was required for a registry to be considered for inclusion.

NUMBER OF DATASETS RECEIVED AND INCLUDED

Data were received from 370 cancer registries covering 521 populations in 80 countries. Data from 80 cancer registries, representing 97 populations, were excluded. Volume X consequently presents cancer incidence data from 68 countries, 290 cancer registries, and 424 populations (Table 1.1).

GEOGRAPHICAL COVERAGE IN CI5 VOLUME X

The geographical coverage in CI5 Volume X by continent is shown in Table 1.2. Data are included from 8 of the 15 African countries that submitted data, 11 of the 11 Central and South American countries, 2 of the 2 North American countries, 15 of the 18 Asian countries, 31 of the 33 European countries, and 3 of the 4 Oceanic countries.

The proportions of cancer registries that submitted datasets for Volume X and were accepted for inclusion (by continent) are as follows: Africa: 44% (8/18), Central and South America: 71% (25/35), North America: 94% (66/70), Asia: 62% (63/101), Europe: 87% (118/135), and Oceania: 91% (10/11).

The proportion of the world's total population covered by the registries included in Volume X is 14%, with the following levels of coverage by continent:

Table 1.1. The number of cancer registry datasets (2003–2007) submitted to and accepted for CI5 Volume X

	Submitted	Accepted
Countries	80	68
Registries	370	290
Populations	521	424

Table 1.2. Geographical coverage in CI5 Volume X by continent

	Countries		Registries		Populations	
	Submitted	Accepted	Submitted	Accepted	Submitted	Accepted
Africa	15	8	18	8	18	8
Central and South America	11	11	35	25	35	25
North America	2	2	70	66	196	180
Asia	18	15	101	63	115	73
Europe	33	31	135	118	136	118
Oceania	4	3	11	10	21	20
Total	80*	68*	370	290	521	424

*The sum of the number of individual countries is greater than the total, reflecting the fact that some countries (i.e. France and the USA) have territory on more than one continent.

Africa: 2%, Central and South America: 8%, North America: 95%, Asia: 6%, Europe: 42%, and Oceania: 78%.

COVERAGE IN THE 10 VOLUMES OF CI5

Fig. 1.1 shows the overall coverage in terms of the number of countries, registries, and populations included in each volume of CI5. A full overview identifying all the registry populations appearing in all 10 volumes, as well as the specific incidence time periods contributed by each registry, is provided in Table 1.3 at the end of this chapter.

The steady increase in coverage of the world's population by cancer registration has been accompanied by significant developments in standardization of registration methodology, definitions, and coding. The editors of the present volume, building on the foundation laid in the first volume, have made every effort to standardize the data presented, or where this was not possible, to draw attention to any differences that might affect comparability between registries. The editorial processes of checking internal coherence, consistency, and completeness are described in Chapters 5 and 6 of this volume, and are broadly based on principles outlined in IARC Scientific Publication No. 95 – *Cancer Registration: Principles and Methods* (Jensen et al., 1991).

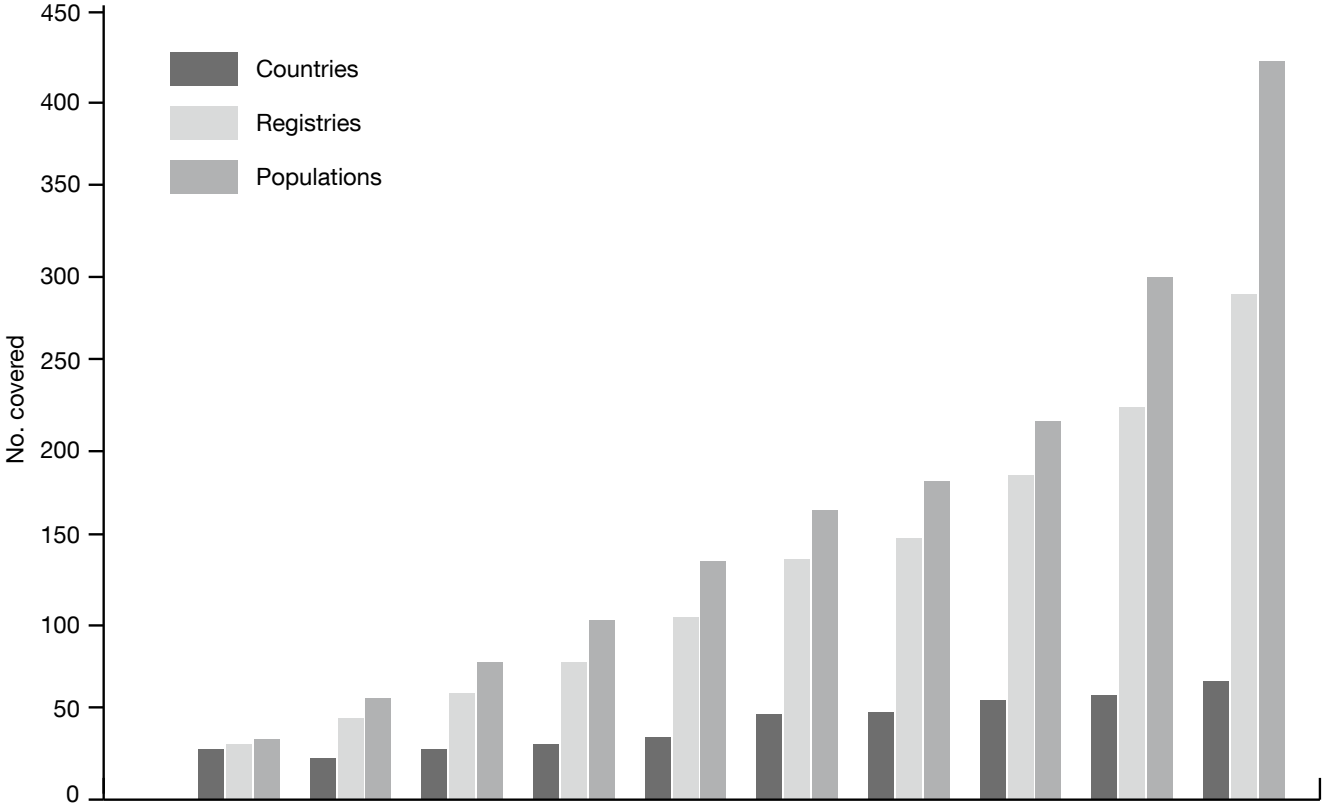
Improved definition of registration methodology and increased adherence to internationally recognized standards have also led to more stringent editorial processes. With each successive volume of CI5, the editors have become more demanding about the quality of the data published in the book. However, the editors also have to accept that some datasets from registries in less-developed countries may be less complete than those from registries in more-developed countries, because of problems of underdiagnosis due to local medical and economic situations (as opposed to underregistration) and/or problems with enumeration of the population. But these datasets are nevertheless of great interest because they describe cancer incidence in populations for which no other information is available and that retain unique cultural habits that may provide valuable clues to cancer etiology. On the pages of this volume that present tables reporting each registry's data by site, an asterisk preceding the registry title indicates that special considerations (which may include underregistration) must be taken into account in interpreting the published rates or indicators of quality (see Chapter 5). The specific reasons for a given asterisk are stated under the heading "Notes on the data" in the accompanying narrative.

CONTENT AND LAYOUT OF THE BOOK

The contact information for all contributing registries, along with the names of the individuals who collaborated in the preparation of this volume, is provided at the beginning of this book. Maps showing the location of each contributing registry are provided on pages 2–22.

Following this introduction, Chapter 2 describes the registries in terms of geographical location, legislative background, and registration practices. Chapter 3 presents the system of classification used to report the incidence data, and addresses the issue of comparability of coding practices between the registries. For selected cancers, the data have been analysed by histological subtype within site. Chapter 4 introduces the histological groupings used and explains the rationale behind them.

Issues that can affect comparability between registries and validity of registry data are discussed in Chapter 5, as are the methods by which the submitted datasets were assessed; and Chapter 6 describes how the raw data received for CI5 were processed. Chapter 7 describes the summary measures of incidence used, and Chapter 8 explains the structure of the various tables included in this book and on the CI5 website (http://ci5.iarc.fr).



ACKNOWLEDGEMENTS

The editors would like to thank Eric Masuyer and Sébastien Antoni, who spent considerable time processing the data and questionnaire responses sent by each submitting registry, and subsequently handled the iterative communications and requests for

clarification from the registries; Mathieu Laversanne, who created the maps; and Isabelle Savage, who acted as the CI5 Volume X Editorial Board secretary, supported by Katiuska Veselinovic. The editors would particularly like to thank the many directors and registrars from all the cancer registries that submitted data to this volume, for their efforts to produce cancer incidence data and make them available to the world. Their work is the cornerstone of descriptive cancer epidemiology, and provides a basis for future cancer research and control policies.

Chapter 2: Registration techniques

David Forman, Charles Gombe Mbalawa, Betsy Kohler, and Rajaraman Swaminathan

A major function of the *Cancer Incidence in Five Continents* (CI5) series is to provide data to those interested in comparing the incidence rates of specific cancers in different populations and over time. But users of these data are advised to consider the factors that may lead to artefactual differences and thereby result in potentially misleading comparisons. The primary purpose of this chapter is to describe variations between the cancer registries included in CI5 Volume X – including variations in populations, the methods used to collect data on new cases, and the sources of data accessed.

All contributors were required to complete an online questionnaire to provide descriptive information about their registry. For each registry, information was collected about the nature and size of the geographical area covered, the reporting facilities and data sources, the procedures for case finding and data abstraction, the coding methods, the type of data collected on incident cases, and the methods of follow-up for vital status. The information provided by each registry included in this volume is tabulated in Tables 2.1–2.3 at the end of this chapter, and in the detailed registry descriptions that follow the introductory chapters.

REGISTRY BACKGROUND (TABLE 2.1)

Table 2.1 lists the registries that contributed to this volume (grouped by geographical area) and provides information about several variables that describe each registry's characteristics, population size, and some basic aspects of operation. The significance of each variable included in Table 2.1 is described here.

Population: The size of the total population at risk on which a rate estimate is based influences the accuracy of that estimate. Rate estimates based on small numbers of individuals are more susceptible to the effects of random variation than are estimates based on large populations. Detailed descriptions of each cancer registry are provided later in this volume, along with the age distribution of the estimated population(s) at risk and the specific sources of the population data. These are usually official sources such as census data, and projections based on information about birth, death, and migration rates. Estimates tend to be more accurate for years closer to a census, and estimates based on interpolations between censuses tend to be more accurate than are projections based only on the previous census. The estimated populations for each registry, listed in Table 2.1, are the estimated average total populations (rounded to the nearest 1000) covered during the reporting period (generally 2003–2007, although some registries provided data for a shorter time period).

Surface area (km^2) **and** ***Population in urban area (%):*** Cancer registries in more-developed countries (such as North American and European countries, Japan, Australia, and New Zealand) may cover very large geographical areas – entire provinces, states, or countries – while the covered populations in less-developed countries are often limited to urban centres. This is due to well-recognized problems with the diagnosis and enumeration of cancer cases in rural populations. Although the calculated incidence rate for an urban area may be a reasonable estimate of the true rate in that community, the rate may not be representative of the entire country in which the registry is located, since lifestyles in rural and urban populations may be very different.

Latitude: The incidence rates of some cancers vary with latitude. This variation may provide evidence of the role of ultraviolet radiation (sunlight) in the etiology of certain cancers; however, similar variations in the rates of other cancers remain unexplained. Information about latitude is provided in Table 2.1 for those interested in investigating this phenomenon further.

Year registry started **and** ***Year population-based data first available:*** Developing a highly complete and accurate cancer registry takes time, and data from recently established registries should therefore be interpreted with some caution. Rates may be underestimated due to incomplete registration. Alternatively, during the early years of data collection, prevalent cases (especially from death certificate diagnosis) may be erroneously included as new incident cases, resulting in the overestimation of incidence rates.

Cancer reportable (yes or no): Legislation or administrative orders making cancer a reportable disease and requiring the reporting of cancers to a registry do not guarantee completeness of reporting. Conversely, the absence of such reporting requirements does not necessarily prevent complete case finding. However, laws or rules requiring reporting generally do enhance registry operations, by ensuring access to (or reporting from) all facilities that diagnose or treat cancer.

Privacy regulations apply (yes or no): An increasing number of registries must operate under privacy regulations that govern the confidentiality of all patient-level data they handle. Such regulations may affect both the ease with which registries can collect data and their ability to share their data with the research community.

Non-residents treated inside registration area (%) **and** ***Estimated cases missed because of problems accessing data sources (%):*** When a registry catchment area has a well-reputed cancer care centre that provides treatment and diagnosis to the population, the number of non-residents treated in the area may be higher than usual. If these non-resident cancer cases are included in the cancer registry database, local rates may be overestimated. Conversely, if there is a cancer centre within reasonable travelling distance outside of a catchment area, that area's rates may be underestimated.

Screening programmes (and starting years, if available): The final five columns of Table 2.1 indicate the starting years of population-based screening programmes for breast, cervical, colorectal, prostate, and oral cancers within the registration areas. These dates are important to consider because the accelerated detection of prevalent cases can inflate incidence estimates, especially during the early years of screening programmes. The abbreviation "NA" (for "not applicable") indicates that a programme does not yet exist in the area.

CASE FINDING, ABSTRACTING, AND CODING (TABLE 2.2)

Table 2.2 lists the usual data sources (primarily diagnostic and clinical facilities) from which cases are identified by each participating cancer registry, and which therefore serve as the basis for the information that is abstracted and recorded by the registry. The most important of these sources are typically pathology laboratories, hospital records (from both public and private hospitals), and death certificates. Together, these sources can provide a reasonably high level of reporting. However, access to records from radiotherapy and oncology departments, hospital discharge records, imaging facilities, and haematology laboratories can also be important. Some registries also obtain information from hospices and palliative care services, outpatient departments, general practitioners, and health insurance companies.

Information from autopsy services is also used by some registries, but the inclusion of cases identified as incidental findings at autopsy may spuriously increase incidence rates. However, with autopsy becoming an increasingly infrequent routine procedure, this source of error is likely to be minor.

In general, the more sources used for case finding, the more complete and accurate the reporting; significant omissions may raise concerns that case finding is incomplete. For example, the absence of any information from radiotherapy facilities would likely be due to a lack of such facilities in the registration area, which might therefore suggest that some cases are missed because patients must go outside the registration area for care. On the other hand, the unavailability of some sources does not necessarily indicate underregistration; for example, the absence of private hospital information in a country with universal public health care may not affect registration. The use of multiple sources of case finding requires efficient record matching and de-duplication procedures to ensure that all records pertaining to the same case are brought together in a single registration, so that multiple recordings of the same cancers do not lead to the overestimation of incidence rates.

TYPES OF INFORMATION RECORDED (TABLE 2.3)

Table 2.3 indicates whether certain patient-level variables are recorded by each of the cancer registries included in CI5 Volume X, which may be of interest to researchers wishing to conduct studies in collaboration with the registries. For example, some registries record unique identifying (ID) numbers (such as national identity numbers, social security numbers, or national health insurance numbers), and this can be very useful for record-linkage studies. Some registries are required to use ID numbers as an alternative to storing patient names (or addresses) in their databases. The other patient-level variables included in Table 2.3 are ethnic group (or race/colour), stage of disease at diagnosis (for selected cancers), and nature of the initial clinical treatment received. The most basic patient-level variables (which are nearly always collected by high-quality population-based registries) are not included in Table 2.3 since they can be assumed to be recorded by all registries in this volume. These universally recorded variables include name, sex, date of birth (or age), permanent residential address, incidence date (usually the date of diagnosis, hospitalization, or first treatment), and primary site and histological type of the cancer diagnosed – preferably coded according to the *International Classification of Diseases for Oncology* (ICD-O) schema (see Chapters 3 and 4).

Table 2.3 also indicates whether there is systematic vital status follow-up of registered patients. This is essential for registries wishing to conduct survival analysis. Information is also provided about whether follow-up is carried out passively (by access to death certificates) and/or by active follow-up of live cases.

The last two columns of Table 2.3 indicate whether each registry follows any standard rules for recording incidence date – for example, the rule sets published by IARC/IACR (Parkin et al., 1994) – and whether each registry can reliably identify subsequent primary cancers diagnosed in an individual previously diagnosed with an initial primary. Some of these recorded variables can provide information relevant to the care of cancer patients and the outcome of disease but are not used in this publication. If required for a specific research study, the data must be obtained from the individual registries.

Chapter 3: Classification and coding

Jacques Ferlay

The *Cancer Incidence in Five Continents* (CI5) series has followed the evolution of the *International Classification of Diseases* (ICD) through four revisions, from the seventh revision (ICD-7) to the tenth (ICD-10), and the creation of a coding scheme for oncology: the *International Classification of Diseases for Oncology* (ICD-O) (WHO, 1976), now in its third edition (ICD-O-3) (Fritz et al., 2000), which is available from http://codes.iarc.fr/. CI5 Volumes I (Doll et al., 1966) and II (Doll et al., 1970) presented data on cancer incidence coded to ICD-7 (WHO, 1957). Volume III (Waterhouse et al., 1976) published data using both ICD-7 and ICD-8 (WHO, 1967). ICD-8, which came into effect in 1968, was also used in Volume IV (Waterhouse et al., 1982). ICD-9 (WHO, 1977) was used for Volumes V (Muir et al., 1987), VI (Parkin et al., 1992), and VII (Parkin et al., 1997). ICD-10 (WHO, 1992) was used for Volumes VIII (Parkin et al., 2002) and IX (Curado et al., 2007), and is also used for the present volume. The updates to ICD-10 since 2010 (available from http://www.who.int/classifications/icd/icd10updates/en/) and the 2011 revision of ICD-O-3 (WHO, 2013; available from http://codes.iarc.fr/) were not considered in this volume, which presents data for the 5-year period of 2003–2007.

The data are published at the level of the three-character ICD-10 codes in the individual registry tables. The groupings of ICD codes adopted in the previous two volumes have been used again in this volume to maintain comparability over time. Table 3.1 presents the individual ICD-10 site codes, the full ICD-10 titles, the Volume X groupings, and the short titles used in the tables of incidence.

CLASSIFICATIONS USED IN THE CANCER REGISTRY

Data submitted for the first four volumes of CI5 were sent in tabular format – organized by sex, site, and 5-year age group – on tape, diskette, or (most commonly) forms specifically designed for the purpose. The only verification possible was to tally the columns and rows. For Volume V, registries were given the option of sending data in the form of a case listing coded to ICD-9 topography only, or to ICD-9 or ICD-O topography plus ICD-O morphology. Only a very small minority of registries sent data coded to ICD-O. Contributors to Volume VI were encouraged to send data as a listing of individual cases, but 24% still sent tabulated data. Starting from Volume VII, data had to be sent as a listing of individual cases. Since the publication in 1976 of the first edition of ICD-O – which clearly defined axes of anatomical location, histology, and behaviour – international conformity to standard classification systems and coding rules has increased steadily. For data published in Volume IV (1973–1977), 90% of registries recorded histological diagnosis. For coding, just over a third of the registries used the American Cancer Society's *Manual of Tumor Nomenclature and Coding* (MOTNAC) (ACS, 1951; 1968), a third had started to use ICD-O, and 12% used the *Systematized Nomenclature of Pathology* (SNOP) (CAP, 1965). About 75% of contributors to Volume V used ICD-O to code histology, and that proportion rose to more than 90% for Volumes VI and VII. Only 4 of the 186 contributors to Volume VIII, 1 of the 225 contributors to Volume IX, and 2 of the 290 contributors to the present volume did not code their histological data to ICD-O. Although most of the data submitted for this volume had been coded or converted to ICD-O-3 (see Chapter 6), registries were also asked what classification systems were used for coding data in the registry during the period. Of the 290 contributors, 265 registries (91.4%) coded to ICD-O topography and morphology (of which 255 used ICD-O-3), 23 registries (7.9%) coded to ICD-9 or ICD-10 topography and ICD-O morphology, and two registries (0.7%) coded to ICD-9 or ICD-10 topography and MOTNAC or the *Systematized Nomenclature of Medicine* (SNOMED) (CAP, 1974) for morphology.

COMPARABILITY

All data supplied for this volume either were already coded to ICD-O-3 when submitted, or were converted by IARC to ICD-O-3 for checking, and were then converted to ICD-10 for presentation (see Chapter 6). This process ensures that the same validity checks and multiple primary rules are applied to all data, and that the final ICD-10 codes used in this publication follow a standard ICD-O-3 to ICD-10 conversion. When a dataset included an ICD-10 code, this was ignored in the tabulations. The ICD-O-3 to ICD-10 conversion program was written at IARC using the rules of the ICD-O-2 to ICD-10 conversion program developed by Percy (1998). The conversion tables strictly follow the ICD-10 coding rules, as expressed in the instruction manual of ICD-10 Volume 2 (Percy et al., 1990) or in the alphabetical index of ICD-10 Volume 3. For example, the combination of unknown primary site (ICD-O-3 topography C80.9) and fibrosarcoma, not otherwise specified (NOS; ICD-O-3 morphology 8810/3) is converted to C49.9: "Connective and other soft tissues, NOS" in ICD-10 (see ICD-10 Volume 2, page 74).

Theoretically, the use of a standard, well-designed coding system such as ICD should make the analysis and tabulation of comparable results a simple matter. But in practice, it has been a continual exercise in detection for the editors of CI5 to establish exactly how registries code various cancers. For the present volume, registries were asked whether any malignant diagnoses were excluded from their data, and how they coded intraductal carcinoma of breast, NOS; ductal and lobular carcinoma in situ of breast; ovarian cystadenoma of borderline malignancy; borderline tumour of ovary; benign tumours of brain and nervous system; and in situ and unspecified carcinoma of bladder (see Table 3.2).

Non-melanoma skin cancer

The incidence of non-melanoma skin cancer (NMSC) is difficult to assess. These cancers are very common and rarely fatal, and the completeness of their registration varies widely depending on access to outpatient and general practitioners' records. Most NMSCs are basal cell carcinomas (BCCs) or squamous cell carcinomas (SCCs); other skin cancers are rare. Although some registries record the first occurrence of all NMSCs, others register BCC only, and many do not collect data on either SCC or BCC.

Bladder cancer

The issue of coding non-invasive tumours (taking into account the recorded level of invasion and grade) – and which to include in the tables as "cancer of the bladder" – has long been a subject of debate. In CI5 Volume VI, it was decided, for the sake of geographical comparability, to exclude tumours of benign, in situ, and unspecified behaviour. In principle, the availability of data as individual case listings with histological type and behaviour should make it possible to publish only data on malignant cancer, by excluding diagnoses with any behaviour code other than /3. But when registries were asked about the behaviour codes they used for non-invasive and unspecified diagnoses of malignant bladder cancer for Volume VII, many of them reported that they assigned the behaviour code /3 to both in situ and unspecified diagnoses, making it impossible to distinguish such cases. As a result, the editors decided to accept that non-invasive diagnoses of bladder cancer are generally considered malignant by pathologists; since Volume VII, the bladder cancer rubric (ICD-10 C67) has therefore included the in situ (ICD-10 D09.0) and unspecified (ICD-10 D41.4) categories. In this volume, whenever possible, the inclusion of neoplasms of uncertain or unknown behaviour together with invasive cancers is indicated by a dagger symbol beside C67 in the tables, and a note on the data in the accompanying narrative. A few registries preferred not to include such cases in their dataset, even when available in the registry, for the sake of continuity over time.

Breast cancer

Intraductal carcinoma, ductal carcinoma in situ (DCIS), and lobular carcinoma in situ of breast are classified in ICD-O-3 as in situ cancers (behaviour code /2). All the registries in CI5 Volume X collect these diagnoses, and very few code any of these diagnoses as malignant (behaviour code /3) (see Table 3.2).

Ovarian cancer

The registries contributing to this volume were asked how they coded ovarian cystadenoma of borderline malignancy and borderline tumour of ovary. The behaviour codes they reported using are tabulated in Table 3.2. Borderline ovarian diagnoses are classified as non-malignant tumours in ICD-O-3 (behaviour code /1) and are excluded from the tabulations, but a few registries still code them as malignant neoplasms.

Brain and central nervous system

Many registries choose to include benign and unspecified tumours of the brain and central nervous system in their data, because of the potentially serious clinical consequences of these tumours. Prior to Volume VII, such tumours may therefore have been included in the tables along with cancers of the brain and nervous system. However, the proportion of such cases varies widely between registries, so since Volume VII they are no longer included.

Myeloproliferative disorders and myelodysplastic syndromes

These include records with the ICD-O-3 morphological codes 9950/3, 996_/3, 9975/3, and 998_/3. Only registries that originally coded their data to ICD-O-3 can report such diagnoses, as they were not considered malignant tumours in ICD-O-2 (behaviour code /1). These codes are converted to the ICD-10 codes D45, D46_, and D47_ by the IARC ICD-O-3 to ICD-10 conversion program, and are presented in two separate categories in the tables (see Table 3.1).

Table 3.1. Classifications used in the incidence tables in CI5 Volume X

ICD-10 site code	Full ICD-10 title	Grouping used in tables	Short title used in tables
C00	Malignant neoplasm of lip	–	Lip
C01	Malignant neoplasm of base of tongue	C01–C02 are grouped	Tongue
C02	Malignant neoplasm of other and unspecified parts of tongue		
C03	Malignant neoplasm of gum	C03–C06 are grouped	Mouth
C04	Malignant neoplasm of floor of mouth		
C05	Malignant neoplasm of palate		
C06	Malignant neoplasm of other and unspecified parts of mouth		
C07	Malignant neoplasm of parotid gland	C07–C08 are grouped	Salivary gland
C08	Malignant neoplasm of other and unspecified major salivary glands		
C09	Malignant neoplasm of tonsil	–	Tonsil
C10	Malignant neoplasm of oropharynx	–	Other oropharynx
C11	Malignant neoplasm of nasopharynx	–	Nasopharynx
C12	Malignant neoplasm of pyriform sinus	C12–C13 are grouped	Hypopharynx
C13	Malignant neoplasm of hypopharynx		
C14	Malignant neoplasm of other and ill-defined sites in the lip, oral cavity and pharynx	–	Pharynx unspecified
C15	Malignant neoplasm of oesophagus	–	Oesophagus
C16	Malignant neoplasm of stomach	–	Stomach
C17	Malignant neoplasm of small intestine	–	Small intestine
C18	Malignant neoplasm of colon	–	Colon
C19	Malignant neoplasm of rectosigmoid junction	C19–C20 are grouped	Rectum
C20	Malignant neoplasm of rectum		
C21	Malignant neoplasm of anus and anal canal	–	Anus
C22	Malignant neoplasm of liver and intrahepatic bile ducts	–	Liver
C23	Malignant neoplasm of gallbladder	C23–C24 are grouped	Gallbladder etc.
C24	Malignant neoplasm of other and unspecified parts of biliary tract		
C25	Malignant neoplasm of pancreas	–	Pancreas
C26	Malignant neoplasm of other and ill-defined digestive organs	C26 is included in other and unspecified	
C30	Malignant neoplasm of nasal cavity and middle ear	C30–C31 are grouped	Nose, sinuses, etc.
C31	Malignant neoplasm of accessory sinuses		
C32	Malignant neoplasm of larynx	–	Larynx
C33	Malignant neoplasm of trachea	C33–C34 are grouped	Trachea, bronchus and lung
C34	Malignant neoplasm of bronchus and lung		
C37	Malignant neoplasm of thymus	C37–C38 are grouped	Other thoracic organs
C38	Malignant neoplasm of heart, mediastinum and pleura		
C39	Malignant neoplasm of other and ill-defined sites in the respiratory system and intrathoracic organs	C39 is included in other and unspecified	
C40	Malignant neoplasm of bone and articular cartilage of limbs	C40–C41 are grouped	Bone
C41	Malignant neoplasm of bone and articular cartilage of other and unspecified sites		
C43	Malignant melanoma of skin	–	Melanoma of skin
C44	Other malignant neoplasms of skin	–	Other skin
C45	Mesothelioma	–	Mesothelioma
C46	Kaposi sarcoma	–	Kaposi sarcoma
C47	Malignant neoplasm of peripheral nerves and autonomic nervous system	C47 is grouped with C49	Connective and soft tissue
C48	Malignant neoplasm of retroperitoneum and peritoneum	C48 is included in other and unspecified	
C49	Malignant neoplasm of other connective and soft tissue	C49 is grouped with C47	
C50	Malignant neoplasm of breast	–	Breast
C51	Malignant neoplasm of vulva	–	Vulva
C52	Malignant neoplasm of vagina	–	Vagina
C53	Malignant neoplasm of cervix uteri	–	Cervix uteri
C54	Malignant neoplasm of corpus uteri	–	Corpus uteri
C55	Malignant neoplasm of uterus, part unspecified	–	Uterus unspecified
C56	Malignant neoplasm of ovary	–	Ovary
C57	Malignant neoplasm of other and unspecified female genital organs	–	Other female genital organs

Table 3.1. (Contd) Classifications used in the incidence tables in CI5 Volume X

ICD-10 site code	Full ICD-10 title	Grouping used in tables	Short title used in tables
C58	Malignant neoplasm of placenta	–	Placenta
C60	Malignant neoplasm of penis	–	Penis
C61	Malignant neoplasm of prostate	–	Prostate
C62	Malignant neoplasm of testis	–	Testis
C63	Malignant neoplasm of other and unspecified male genital organs	–	Other male genital organs
C64	Malignant neoplasm of kidney, except renal pelvis	–	Kidney
C65	Malignant neoplasm of renal pelvis	–	Renal pelvis
C66	Malignant neoplasm of ureter	–	Ureter
C67	Malignant neoplasm of bladder	–	Bladder
C68	Malignant neoplasm of other and unspecified urinary organs	–	Other urinary organs
C69	Malignant neoplasm of eye and adnexa	–	Eye
C70	Malignant neoplasm of meninges	C70–C72 are grouped	Brain, nervous system
C71	Malignant neoplasm of brain		
C72	Malignant neoplasm of spinal cord, cranial nerves and other parts of central nervous system		
C73	Malignant neoplasm of thyroid gland	–	Thyroid
C74	Malignant neoplasm of adrenal gland	–	Adrenal gland
C75	Malignant neoplasm of other endocrine glands and related structures	–	Other endocrine
C76	Malignant neoplasm of other and ill-defined sites	C76 is included in other and unspecified	
C80	Malignant neoplasm without specification of site	C80 is included in other and unspecified	
C81	Hodgkin disease	–	Hodgkin lymphoma
C82	Follicular (nodular) non-Hodgkin lymphoma	C82–C85 and C96 are grouped	Non-Hodgkin lymphoma
C83	Diffuse non-Hodgkin lymphoma		
C84	Peripheral and cutaneous T-cell lymphomas		
C85	Other and unspecified types of non-Hodgkin lymphoma		
C88	Malignant immunoproliferative diseases	–	Immunoproliferative diseases
C90	Multiple myeloma and malignant plasma cell neoplasms	–	Multiple myeloma
C91	Lymphoid leukaemia	–	Lymphoid leukaemia
C92	Myeloid leukaemia	C92–C94 are grouped (following ICD-O-3)	Myeloid leukaemia
C93	Monocytic leukaemia		
C94	Other leukaemias of specified cell type		
C95	Leukaemia of unspecified cell type	–	Leukaemia unspecified
C96	Other and unspecified malignant neoplasms of lymphoid, haematopoietic and related tissue	C96 is grouped with C82–C85	
O&U	Other and unspecified	Includes C26, C39, C48, C76, and C80	Other and unspecified
MPD	Myeloproliferative disorders	Includes ICD-O-3 M9950/3, M996_/3, and M9975/3	Myeloproliferative disorders
MDS	Myelodysplastic syndromes	Includes ICD-O-3 M998_/3	Myelodysplastic syndromes
C00-96			All sites
C00-96 exc. C44			All sites except C44

Chapter 4: Histological groups

Jacques Ferlay and Brian Rous

BACKGROUND

The data presented in this volume of *Cancer Incidence in Five Continents* (CI5) are mainly organized by the predominantly site-based categories of Chapter II (Neoplasms) of the 10th revision of the *International Classification of Diseases* (ICD-10; WHO, 1992) (see Chapter 3 of this book). However, for some sites of cancer, the histological type is particularly relevant clinically and/or epidemiologically. In the present volume, the data are grouped according to histological types as originally defined in CI5 Volume IX (Curado et al., 2007) and listed in this chapter.

GENERAL STRUCTURE

The main structure of the histological grouping is that specific types of malignant neoplasms are listed, as well as the category "Unspecified malignant neoplasm" (i.e. malignant tumours that are so poorly differentiated that we are unable to classify them into major groups such as carcinoma or sarcoma). Neoplasms that have a specific morphology but are too rare to be listed among the major histological groups are grouped together in the category "Other specified malignant neoplasm". Similarly, in the category "Carcinoma", specific subtypes, such as "Squamous cell carcinoma" and "Adenocarcinoma", are listed, as well as "Unspecified carcinoma" (i.e. carcinomas that are so poorly differentiated that we are unable to classify them according to histological subtype, although it is still possible to distinguish them from non-epithelial malignant neoplasms such as sarcoma). Morphological codes are listed for the specific types of neoplasm (or carcinoma), and for "Unspecified malignant neoplasm" (or carcinoma). The remaining codes of neoplasia (or carcinoma) are then automatically assigned to the "Other specified malignant neoplasm" (or carcinoma) category.

SITES

For inclusion in CI5 as a distinct histological type within a site group, a type must be both sufficiently common at the site and clinically epidemiologically relevant. The following 15 organ sites are included in this chapter, with accompanying histological type information: oesophagus, anus, liver, lung, bone, skin, cervix uteri, corpus uteri, ovary, testis, kidney and renal pelvis, urinary bladder, eye, brain and central nervous system, and thyroid, as well as haematological malignancies. Some major cancer sites, such as breast and prostate, are not included, because most malignant neoplasms at these sites are adenocarcinomas, and the coding of adenocarcinoma subtypes is not consistent. Kidney was combined with renal pelvis because some urothelial carcinomas originating from the renal pelvis are site coded as kidney cancers, while others are coded as renal pelvis cancers. Hodgkin lymphoma and leukaemias are combined together in the haematological group.

TYPES OF NEOPLASMS INCLUDED

The CI5 Volume X data include all invasive malignant neoplasms and some non-invasive malignant neoplasms. For most morphology codes, a fifth digit of /1 or /2 automatically excludes data entry. Carcinoma in situ is reported by many cancer registries, but is not generally dealt with in this volume, with the exception of urothelial carcinoma in situ. A few lesions of borderline malignancy are included, such as low-grade non-invasive papillary transitional cell tumours, which are now designated as papillary urothelial neoplasia of low malignant potential (PUNLMP) (8130/1). Flat carcinoma in situ of the urothelium (8120/2) and PUNLMP (8130/1, 8130/2) have been grouped with transitional cell carcinoma in this volume. Because skin has been added to the sites, basal cell carcinoma is reported as a separate group, although many cancer registries do not have statistics on these tumours. Within the 15 organ sites presented, there are no cases of mesothelioma (ICD-O M905_), Kaposi sarcoma (9140), lymphoma, or leukaemia (9590–9989), as these cancers have their own specific ICD-10 codes and are presented separately in this volume.

MORPHOLOGY CODES

The grouping of morphology codes presents several difficulties. The ICD-O system is based on separate site (topography) and morphology (histology) codes that can be combined. Inevitably, in cancer registry data, morphology codes are sometimes mistakenly combined with codes for sites where these entities do not occur or have not been reported. Some morphology codes are redundant (i.e. multiple codes can be applied for the same tumour). Other codes are obsolete (i.e. the entities have been renamed or deleted in later revisions of tumour classifications). A major difficulty is the variation in coding precision (specific codes for tumour subtypes vs comprehensive codes for broad categories such as adenocarcinoma), which limits the utility of detailed codes. An example of this is kidney tumours. Renal cell carcinomas are often coded as

renal cell carcinoma, not otherwise specified (NOS) (8312) or adenocarcinoma, NOS (8140), while others are subtyped. Therefore, all carcinomas of the kidney are grouped together in this chapter.

Some cancer types occur in several organs but have different clinical behaviour depending on the site of origin. For most sites, adenosquamous carcinoma (8560) and mucoepidermoid carcinoma (8430) are included in the category "Other specified carcinoma". An exception is the corpus uteri (C54), where these are included in the category "Adenocarcinoma" because they are thought to have similar biology (Zaino and Kurman, 1988). Furthermore, squamous differentiation is very common in endometrioid carcinoma (8380–8383), which makes it difficult to differentiate between these tumours. Another example is metaplastic carcinoma (8575), which is generally included in the category "Other specified carcinoma". However, for the corpus uteri, it is included in the category "Other specified malignant neoplasm", because metaplastic carcinoma is considered equivalent to carcinosarcoma at this site (Silverberg et al., 1990).

The "Unspecified carcinoma" category includes tumours that are coded as carcinoma, NOS, but also some descriptive diagnoses of poorly differentiated cancers. These tumours can be recognized as carcinomas but are too undifferentiated to be further classified according to their histogenetic origin. This group generally includes the morphology codes 8010–8035. An exception is in the lung, where "Large cell carcinoma" is a separate category in the WHO classification, and includes 8010–8012, 8014–8031, and 8035 (Travis et al., 2004). The thyroid is another exception, where "Anaplastic carcinoma" is also a specific category in the WHO classification, and includes the morphology codes 8020–8035 (DeLellis et al., 2004).

Some tumours are evidently miscoded in cancer registry data, because their incidence is far higher than expected. Papillary carcinomas, NOS are listed in the category "Squamous cell neoplasm" in ICD-O-3 (Fritz et al., 2000). But most bladder tumours for which this code is used are probably miscoded urothelial carcinomas rather than papillary squamous cell carcinomas, and they are therefore included in the "Transitional cell carcinoma" category. In the thyroid, it can be assumed that carcinomas assigned the morphology code 8050 are actually papillary carcinomas of the thyroid, and they are therefore included in that category. In the kidney, it can be assumed that the majority of tumours with the morphology code 8050 are miscoded papillary renal cell carcinomas, and they are consequently included in the "Renal cell carcinoma" category.

OESOPHAGUS (C15)

The "Adenocarcinoma" category excludes linitis plastica (8142), which occurs in the gastric epithelium. The "Squamous cell carcinoma" category includes basaloid squamous cell carcinoma (8083). The principal cancers in the "Other specified carcinoma" category are large cell carcinoma (8012–8014) and small cell carcinoma (8041–8045). Melanoma and carcinosarcoma are included in the category "Other specified malignant neoplasm".

Table 4.1. Oesophagus (C15)

1 Carcinoma	**8010–8576**
1.1 Squamous cell carcinoma	8050–8078, 8083–8084
1.2 Adenocarcinoma	8140–8141, 8143–8145, 8190–8231, 8260–8263, 8310, 8401, 8480–8490, 8550–8551, 8570–8574, 8576
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

ANUS (C21)

The category "Squamous cell carcinoma" includes basaloid and cloacogenic carcinomas (8123–8124) and basaloid squamous cell carcinoma (8083). Cloacogenic carcinoma is a controversial entity, sometimes defined as carcinoma arising from the anal transition zone, and sometimes as a morphological variant of squamous cell carcinoma. The term "basaloid carcinoma" has also been used to designate this group of tumours. Their reported incidence is highly variable, possibly because of the confusing nomenclature. Hence, these tumour types are included in the category "Squamous cell carcinoma".

Table 4.2. Anus (C21)

1 Carcinoma	**8010–8576**
1.1 Squamous cell carcinoma	8050–8076, 8083–8084, 8123–8124
1.2 Adenocarcinoma	8140–8145, 8190–8231, 8260–8263, 8310, 8401, 8480–8490, 8550–8551, 8570–8574, 8576
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8011
2 Melanoma	**8720–8790**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

LIVER (C22)

The category "Hepatocellular carcinoma" includes hepatoid carcinomas (8576), under the assumption that these are actually miscoded hepatocellular carcinomas. The category "Cholangiocarcinoma" encompasses all primary carcinomas of the liver of biliary epithelial type (i.e. it excludes hepatocellular carcinoma and combined hepatocellular and cholangiocarcinoma). Combined hepatocellular and cholangiocarcinoma (8180) is included in the "Other specified carcinoma" category, as are carcinoids.

Table 4.3. Liver (C22)

1 Carcinoma	**8010–8576**
1.1 Hepatocellular carcinoma	8170–8176
1.2 Cholangiocarcinoma (all intrahepatic biliary carcinomas, i.e. all primary adenocarcinomas)	8050, 8140–8141, 8160–8161, 8260, 8440, 8480–8500, 8570–8572
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Hepatoblastoma	**8970**
3 Sarcoma	
3.1 Haemangiosarcoma	9120–9133, 9161
3.2 Other sarcomas	8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9150, 9170, 9540–9581
4 Other specified malignant neoplasm	
5 Unspecified malignant neoplasm	**8000–8005**

LUNG (C34)

One change has been made in the histological groupings for lung cancer since Volume IX: neuroendocrine carcinoma, NOS (M-8246/3), which had previously been included in the "Small cell carcinoma" category, is now classified under "Other specified carcinoma". The "Squamous cell carcinoma" category includes papillary carcinomas, NOS (8050), because these are listed under "Squamous cell neoplasm" in ICD-O-3. The category "Adenocarcinoma" includes bronchiolo-alveolar adenocarcinoma (8250–8254) but excludes adenoid cystic (8200), mucoepidermoid (8430), and adenosquamous (8560) carcinomas, which are instead included in the category "Other specified carcinoma". The category "Large cell carcinoma" includes cancers so described (8012), as well as other morphological variants of undifferentiated carcinomas (except those with neuroendocrine or spindle cell differentiation) and clear cell adenocarcinoma (8310). The category "Other specified carcinoma" includes non-small cell carcinoma (8046); carcinoid tumours (8240–8245); and adenoid cystic (8200), mucoepidermoid (8430), adenosquamous (8560), and large cell neuroendocrine (8013) carcinomas.

Table 4.4. Lung (C34)

1 Carcinoma	**8010–8576**
1.1 Squamous cell carcinoma	8050–8078, 8083–8084
1.2 Adenocarcinoma	8140, 8211, 8230–8231, 8250–8260, 8323, 8480–8490, 8550–8551, 8570–8574, 8576
1.3 Small cell carcinoma	8041–8045
1.4 Large cell carcinoma (including giant cell, clear cell and large cell undifferentiated carcinoma)	8010–8012, 8014–8031, 8035, 8310
1.5 Other specified carcinoma	
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

BONE (C40–C41)

The main categories are "Osteosarcoma", "Chondrosarcoma", and "Ewing sarcoma". These three groups encompass the same ICD-O entities as groups VIII A–C in the third edition of *International Classification of Childhood Cancer* (Steliarova-Foucher et al., 2005). The "Other specified sarcoma" category includes epithelioid sarcoma (8804), fibrosarcoma (8810–8812), malignant fibrous histiocytoma (8830), liposarcomas (8850–8858), angiosarcomas (9120–9133), and malignant giant cell tumours (9250). The "Other specified malignant neoplasm" category includes desmoplastic small round cell tumour (8806), mesenchymoma (8990), chordoma (9370–9372), adamantinomas (9261, 9310), and primitive neuroectodermal tumour (PNET) (9473).

Table 4.5. Bone (C40–C41)

1 Sarcoma	**8800–8921, 9040–9044, 9120–9133, 9150, 9180–9250, 9260, 9540–9581**
1.1 Osteosarcoma	9180–9200
1.2 Chondrosarcoma	9210–9243
1.3 Ewing sarcoma	9260
1.4 Other specified sarcoma	
1.5 Unspecified sarcoma	8800–8803, 8805
2 Other specified malignant neoplasm	
3 Unspecified malignant neoplasm	**8000–8005**

SKIN (C43–C44)

Basal cell carcinoma is registered and reported by several cancer registries, and has therefore been included.

Table 4.6. Skin (C43–C44)

1 Carcinoma	**8010–8576**
1.1 Squamous cell carcinoma	8050–8078, 8083–8084
1.2 Basal cell carcinoma	8090–8098
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Melanoma	**8720–8790**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

CERVIX UTERI (C53)

Mucoepidermoid carcinoma (8430) and adenosquamous carcinoma (8560) are included in the category "Other specified carcinoma". The "Other specified malignant neoplasm" category includes Mullerian mixed tumour (8950), carcinosarcoma (8980), and melanoma (8720–8790). Malignant endometrioid adenofibroma (8381) is also classified as "Other specified malignant neoplasm".

Table 4.7. Cervix uteri (C53)

1 Carcinoma	**8010–8380, 8382–8576**
1.1 Squamous cell carcinoma	8050–8078, 8083–8084
1.2 Adenocarcinoma	8140–8141, 8190–8211, 8230–8231, 8260–8263, 8310, 8380, 8382–8384, 8440–8490, 8570–8574, 8576
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

CORPUS UTERI (C54)

Squamous cell carcinomas are included in the category "Other specified carcinoma" because of their rarity at this site. Unlike for other sites, mucoepidermoid (8430) and adenosquamous (8569) carcinomas are included in the category "Adenocarcinoma", because squamous differentiation is very common in adenocarcinoma of the corpus uteri, and it is assumed that partial squamous differentiation does not change the behaviour of these neoplasms. Also, unlike for other sites, metaplastic carcinoma (8575) is included in the category "Other specified malignant neoplasm", because in the corpus uteri, metaplastic carcinoma of the endometrium has been equated with carcinosarcoma.

Table 4.8. Corpus uteri (C54)

1 Carcinoma	**8010–8574, 8576**
1.1 Adenocarcinoma (including mucoepidermoid and adenosquamous carcinoma)	8140–8141, 8190–8211, 8230–8231, 8260–8263, 8310, 8380, 8382–8384, 8430, 8440–8490, 8510, 8560, 8570–8574, 8576
1.2 Other specified carcinoma	
1.3 Unspecified carcinoma	8010–8035
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990-8991, 9040–9044, 9120–9133, 9150, 9540-9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

OVARY (C56)

The first four carcinoma categories listed here correspond to malignant serous, mucinous, endometrioid, and clear cell tumours. Among the carcinomas not included in these four groups, there are various adenocarcinomas that cannot with certainty be allocated to any of the above groups, and are hence included in the category "Adenocarcinoma, NOS". This category also includes papillary adenocarcinoma (8260), cystadenocarcinoma (8440), and other variants of adenocarcinoma. Within the category "Adenocarcinoma, NOS", there are most likely a substantial number of tumours that actually belong to categories 1.1–1.4. Truly unclassified adenocarcinomas of the ovary are uncommon. Sex cord-stromal tumours have their own group. The category "Germ cell tumours" includes dysgerminomas, embryonal carcinomas, and teratomas, as well as the rare carcinoid tumours of the ovary, and the very rare gonadoblastomas. Lipid cell tumours, malignant Brenner tumours, and sarcomas are very rare and are consigned to the category "Other specified malignant neoplasm".

Table 4.9. Ovary (C56)

1 Carcinoma	**8010–8231, 8246–8576, 9014–9015, 9110**
1.1 Serous carcinoma	8441, 8460–8463, 9014
1.2 Mucinous carcinoma	8470–8490, 9015
1.3 Endometrioid carcinoma	8380–8383, 8560, 8570
1.4 Clear cell carcinoma	8310–8313, 9110
1.5 Adenocarcinoma, NOS	8140–8147, 8170–8190, 8211–8231, 8260, 8384, 8440, 8576
1.6 Other specified carcinoma	
1.7 Unspecified carcinoma	8010–8035
2 Sex cord-stromal tumours	**8590–8671**
3 Germ cell tumours	**8240–8245, 9060–9102**
4 Other specified malignant neoplasm (including Mullerian mixed tumour, carcinosarcoma)	
5 Unspecified malignant neoplasm	**8000–8005**

TESTIS (C62)

Spermatocytic seminoma has a more favourable prognosis than does seminoma, and these tumours should not be grouped together. Embryonal carcinoma, malignant teratoma, yolk sac tumour, choriocarcinoma, and mixed germ cell tumours are included in the category "Non-seminomatous germ cell tumours". Sex cord-stromal tumours are included in the category "Other specified malignant neoplasm".

Table 4.10. Testis (C62)

1 Germ cell tumours	**9060–9102**
1.1 Seminoma	9060–9062, 9064
1.2 Spermatocytic seminoma	9063
1.3 Non-seminomatous germ cell tumours	9065–9102
2 Other specified malignant neoplasm	
3 Unspecified malignant neoplasm	**8000–8005**

KIDNEY (C64) AND RENAL PELVIS (C65)

There are several major difficulties with the histological grouping of kidney tumours. Transitional cell and squamous carcinomas in the kidney usually originate from the renal pelvis, although it may be difficult to trace the origin of the tumour. It can be assumed that some of these are site coded kidney (C64) and others renal pelvis (C65). Hence, these two sites are now grouped.

Renal cell carcinomas have recently undergone a reclassification based on molecular, cytogenetic, morphological, and clinical data. However, a substantial portion of these tumours are coded as renal cell carcinoma, NOS (8312) or adenocarcinoma, NOS (8140), while others are subtyped. Therefore, the "Renal cell carcinoma" category includes adenocarcinoma, NOS (8140), specific subtypes of renal cell carcinoma, and also obsolete entities such as granular cell carcinoma (8320). Papillary carcinoma, NOS (8050) is listed under "Squamous cell neoplasm" in ICD-O-3. When this code is used for renal tumours, it is probably most often a miscoding of papillary renal carcinoma, and it is therefore included in the "Renal cell carcinoma" category as well.

Table 4.11. Kidney (C64) and renal pelvis (C65)

1 Carcinoma	**8010–8576**
1.1 Squamous, transitional cell carcinoma	8051–8084, 8120–8122, 8130–8131
1.2 Renal cell carcinoma	8050, 8140, 8260, 8270, 8280–8312, 8316–8320, 8340–8344
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Other specified malignant neoplasm	
3 Unspecified malignant neoplasm	**8000–8005**

URINARY BLADDER (C67)

The classification of urinary bladder tumours has undergone several revisions in recent years. Some low-grade papillary transitional cell tumours are now designated as PUNLMP (8130/1). To enable longitudinal comparisons, flat carcinoma in situ (8120/2) and PUNLMP (8130/1, 8130/2) have been included in the category "Transitional cell carcinoma".

Papillary carcinomas, NOS (8050) are listed under "Squamous cell neoplasm" in ICD-O-3. But when this code is used for bladder tumours, it is probably most often a miscoding of transitional cell carcinoma, and it is therefore included in the "Transitional cell carcinoma" category. Pheochromocytoma, malignant paraganglioma, melanoma, and carcinosarcoma are included in the "Other specified malignant neoplasm" category.

Table 4.12. Urinary bladder (C67)

1 Carcinoma	**8010–8576**
1.1 Squamous cell carcinoma	8051–8078, 8083–8084
1.2 Transitional cell carcinoma (including transitional cell carcinoma with squamous and/or glandular differentiation)	8050, 8120–8122, 8130–8131
1.3 Adenocarcinoma	8140–8145, 8190–8231, 8260–8263, 8310, 8401, 8480–8490, 8550–8551, 8570–8574, 8576
1.4 Other specified carcinoma	
1.5 Unspecified carcinoma	8010–8035
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

EYE (C69)

The principal eye cancers – retinoblastoma and malignant melanoma – form two categories. The carcinomas are divided into three subgroups: "Squamous cell carcinoma" (70% of the carcinomas, principally tumours of the conjunctiva and cornea), "Other specified carcinoma" (14.6% of the carcinomas, comprising almost entirely adenocarcinomas and mainly originating in the lacrimal gland and duct), and "Unspecified carcinoma". Squamous cell carcinomas that are site coded for the eye (C69) probably include some cancers that originate in the skin (C44) of the eyelids.

Table 4.13. Eye (C69)

1 Retinoblastoma	**9510–9513**
2 Malignant melanoma	**8720–8790**
3 Carcinoma	**8010–8576**
3.1 Squamous cell carcinoma	8050–8078, 8083–8084
3.2 Other specified carcinoma	
3.3 Unspecified carcinoma	8010–8035
4 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
5 Other specified malignant neoplasm	
6 Unspecified malignant neoplasm	**8000–8005**

BRAIN AND CENTRAL NERVOUS SYSTEM (C71–C72)

These categories are based on those of the WHO *Pathology and Genetics of Tumours of the Nervous System* classification (Kleihues and Cavenee, 1997). Atypical teratoid/rhabdoid tumour (9508) is included in the "Embryonal tumours" category. The "Other neuroepithelial tumours" category includes olfactory, pineal, and some pituitary tumours, such as craniopharyngioma (9350–9352); pinealoma, pineocytoma, and pineoblastoma (9360–9362); and olfactory neuroepitheliomatous neoplasms (9520–9523). The term "pinealoma" (9360) encompasses pineocytoma (9361) and pineoblastoma (9362). Lymphomas and haematopoietic neoplasms are not included.

Table 4.14. Brain and central nervous system (C71–C72)

1 Tumours of neuroepithelial tissue	**8680, 9350–9362, 9380–9508, 9520–9523**
1.1 Gliomas	9380–9384, 9391–9460
1.1.1 Astrocytic tumours	9384, 9400–9421, 9424, 9440–9442
1.1.2 Oligodendroglial tumours and mixed gliomas	9382, 9450–9451
1.1.3 Ependymal tumours	9383, 9391–9394
1.1.4 Gliomas, others	9380–9381, 9423, 9430, 9444, 9460
1.2 Embryonal tumours	9470–9474, 9490, 9500–9504, 9508
1.2.1 Medulloblastoma	9470–9472, 9474
1.2.2 Other	9473, 9490, 9500–9504, 9508
1.3 Other neuroepithelial tumours	
2 Other specified malignant neoplasm	
3 Unspecified malignant neoplasm	**8000–8005**

THYROID (C73)

Follicular and papillary carcinomas constitute the majority of thyroid cancers. The "Papillary carcinoma" category includes follicular carcinomas with a papillary component (8340). It is assumed that most cases of papillary squamous carcinoma (8050) are actually papillary carcinomas, and they are therefore included in this category as well. "Minimally invasive follicular carcinoma" (8335) is a new code in ICD-O-3, and is included in the category "Follicular carcinoma".

Squamous carcinoma is no longer recognized as a major histological type in the WHO classification, and it is therefore included in the category "Other specified carcinoma".

"Anaplastic carcinoma" (encompassing undifferentiated, giant cell, and spindle cell carcinomas) is a separate category from "Unspecified carcinoma". Poorly differentiated carcinoma is a controversial entity and has been classified under "Anaplastic carcinoma". Small cell carcinoma (8040–8045) is specifically excluded, since the great majority of tumours previously so diagnosed are in fact lymphomas.

Insular thyroid carcinoma (8337) is a distinctive clinicopathological entity that has been included in the "Other specified carcinoma" category. Mixed medullary-follicular carcinoma (8346) and mixed medullary-papillary carcinoma (8347) are also included in this category.

Table 4.15. Thyroid (C73)

1 Carcinoma	**8010–8576**
1.1 Follicular carcinoma	8290, 8330–8335
1.2 Papillary carcinoma	8050, 8260, 8340–8344, 8350, 8450–8460
1.3 Medullary carcinoma	8345, 8510–8513
1.4 Anaplastic carcinoma	8020–8035
1.5 Other specified carcinoma	
1.6 Unspecified carcinoma	8010–8015
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

HAEMATOPOIETIC AND LYMPHOID TISSUES (9590–9989)

Hodgkin lymphoma has been reclassified, and the previous category "Lymphocytic predominance" (9657–9659, 9660) has been replaced by the new categories "Nodular lymphocytic predominance" (9659) and "Classical lymphocyte-rich" (9651). The category "Non-Hodgkin lymphoma NOS" is used because some cancer registries lack sufficiently specific data for lineage-based classification.

Table 4.16. Haematopoietic and lymphoid tissues (9590–9989)

1 Hodgkin lymphoma	**9650–9667**
1.1 Nodular lymphocytic predominance	9659
1.2 Classical lymphocyte-rich	9651
1.3 Nodular sclerosis	9663–9667
1.4 Mixed cellularity	9652
1.5 Lymphocytic depletion	9653–9655
1.6 Unspecified	
2 B-cell neoplasms	**9670–9699, 9728, 9731–9734, 9761–9764, 9823–9826, 9833, 9836, 9940**
3 T-cell and NK-cell neoplasms	**9700–9719, 9729, 9827–9831, 9834, 9837, 9948**
4 Myeloid neoplasms	**9840, 9860–9931, 9945–9946, 9950, 9960–9964, 9975, 9980–9989**
5 Non-Hodgkin lymphoma NOS	**9591**
6 Other specified malignant neoplasms	
7 Unspecified malignant neoplasms	**9590, 9596, 9727, 9760, 9800–9801, 9805, 9820, 9832, 9835**

Chapter 5: Data comparability and quality

Freddie Bray, Betsy Kohler, and Jacques Ferlay

INTRODUCTION

The value of any cancer registry relies heavily on the underlying quality of its data and the quality control procedures it has in place; the primary function of *Cancer Incidence in Five Continents* (CI5) is to enable the comparison of cancer incidence rates across different populations worldwide. In the evaluation of registered cases, three dimensions of quality are assessed to ensure that registry submissions to this volume meet a sufficiently high standard for inclusion.

Comparability is the extent to which a registry's coding and classification procedures and definitions adhere to established international standards and guidelines. The definition of an incident case is especially important in evaluating comparability.

Completeness is the degree to which all diagnosed neoplasms within a registry's catchment population are included in the registry database. Several methods can be used to evaluate the level of completeness of the enumeration of cases within a catchment population.

Validity (or accuracy) is the proportion of cases recorded as having a given characteristic that truly do have that attribute. Several indicators of validity relate to the precision of a registry's source documents and the level of expertise in abstracting, coding, and recoding cases.

The preparation and evaluation of the indices of data quality for CI5 requires careful attention from the volume editors, to ensure that all accepted datasets are of sufficiently high quality to merit their inclusion in the volume. The editorial procedures used to conduct a transparent and impartial evaluation of each submitted dataset are outlined in this chapter.

ELEMENTS OF THE EVALUATION

The practical aspects and techniques of evaluating cancer registry data quality have been examined in a two-part review (Bray and Parkin, 2009; Parkin and Bray, 2009), and were briefly described – with an emphasis on low- and middle-income settings – in the recent IARC Technical Publication No. 43: *Planning and Developing Population-based Cancer Registration in Low- and Middle-income Settings* (Bray et al., 2014). The editorial board of CI5 Volume X sought to comprehensively assess data quality on the basis of the indicators of comparability, completeness, and validity reported in these publications. The board refrained, however, from applying the more rigidly defined evaluations and groupings (based on ranges of acceptability) that were introduced in Volume IX (Curado et al., 2007). Although there was some value in developing quality thresholds to enhance the transparency of the editorial process, an undesirable consequence was the automatic exclusion of certain registries on the basis of a low or high value for a single indicator, without further assessment. More in keeping with the approach taken in Volume VIII (Parkin et al., 2002), readers can examine and form their own opinions on the quality of individual datasets by reviewing the accompanying comparative tabulations and graphics, just as the editors have done in compiling the information. These tables and figures serve as a guide to evaluating registries' adherence to the standard definitions and recommendations, and the completeness and validity of their data.

The editors carried out an extensive process of verifying coding, identifying duplicate registrations, querying unlikely or impossible combinations of codes, and converting the data to a standard format before formal editorial consideration. At the editorial board's meetings, the editors consulted a series of pre-assembled registry-specific tables and other documentation:

- a set of editorial tables (see the examples at the end of this chapter, generated using a hypothetical 2003–2007 dataset for a fictional registration area called Erewhon);
- tables of site-specific case numbers, age-specific rates, and summary rates (crude, cumulative, and age-standardized), as presented in this volume;
- the populations at risk by sex and age, including the source or method of estimation used (where applicable), and a comparison with the previous 5-year population data (where available), as presented in this volume; and
- the completed questionnaires, including responses related to the definitions used by each registry.

This review process was routinely applied to the evaluation of most of the 521 datasets submitted, but the increasing number of registries submitting data (including many new registries submitting for the first time) also warranted additional comparative overviews of key quality indicators across registries by region and country. As in previous volumes, asterisks are used to denote datasets for which particular consideration is required in interpreting the numerical results for some or all cancer sites (see the *Notes on the datasets* section later in this chapter).

COMPARABILITY

Determining the extent of the comparability of a cancer dataset requires consideration of the registry's procedures, including the standards and definitions used in registration. In the preparation of this volume, the editorial team particularly focused on the following procedural aspects:

- the system used for classifying and coding neoplasms;
- the definition of incidence – what constitutes a cancer case, the definition of date of incidence, and the rules for dealing with multiple primaries (i.e. for distinguishing new cases of primary cancer from extensions, recurrences, or metastases of existing cases); and
- the registration of cancers detected in asymptomatic individuals.

International standards for the classification and coding of neoplasms

The registries were asked to submit their data coded according to the third edition of the *International Classification of Diseases for Oncology* (ICD-O-3) (Fritz et al., 2000), as well as to verify (and if necessary, to correct) their data before submission. Coding from other systems can be converted to ICD-O-3 using software such as IARCcrgTools (Ferlay et al., 2005).

ICD-O-3 provides a standardized system for coding the following aspects of disease classification:

- **topography:** the anatomical location (body site) of the tumour;
- **morphology:** the microscopic appearance and cellular origin of the tumour;
- **behaviour:** the classification of the tumour as malignant, benign, in situ, or of uncertain behaviour;
- **grade:** the extent of differentiation of the tumour; and
- **basis of diagnosis:** the method of diagnosis used.

Definition of incidence

The CI5 Volume X call for data specifically requested the submission of data on all primary tumours, including data (if collected) on basal and squamous cell skin cancers and non-malignant tumours of the central nervous system and urinary bladder. The rules for determining incidence date and multiple primaries are briefly described below.

Incidence date: Because the period from the occurrence of the first mutation to the clinical diagnosis of cancer often spans decades, a standardized definition of cancer is needed for determining whether to register a case and establishing the precise date when the disease became incident. Incidence dates are commonly defined using a hierarchical set of rules from one of three available algorithms, published by IARC (Jensen et al., 1991), the European Network of Cancer Registries (ENCR) (Pheby et al., 1997), and the SEER Program (Johnson et al., 2007). The registries were asked to state whether one of these algorithms or other, in-house rules were applied.

Multiple primaries: Because an individual may develop more than one cancer, there must be a clear distinction between new cases (to be counted as incident cancers) and cases that are actually extensions, recurrences, or metastases of an existing cancer. There are two sets of rules commonly used by cancer registries for this purpose. The SEER rules (Johnson et al., 2007) are used mainly by cancer registries in North America, whereas the jointly developed IARC/IACR rules (IARC, 2004) tend to be used throughout the rest of the world, at least for the purpose of reporting incidence rates.

The SEER rules result in somewhat higher incidence rates because they allow for the occurrence of multiple incident cancers at the same body site, providing the new case occurs 2 months to 5 years (depending on the site) after an earlier diagnosis, whereas the IARC/IACR rules allow for only one cancer per body site during a patient's lifetime, unless there are multiple cancers of different histological types. The SEER rules also recognize new cases at different subsites of the same organ (e.g. the colon and the skin) or on opposite sides of the body (for paired organs).

Links to these rules were provided to all contributors to this volume. The registries were asked to include all multiple primary tumours in their submitted datasets for the time period covered (2003–2007) and to state which set of rules was used to define new primary cancers, and whether these could be distinguished from subsequent primaries that occur in the same person. The sites at which varying definitions of multiple primaries are likely to have the largest effect on incidence rates are listed in Table 5.1, along with the percentage differences in incidence at these sites (among a subset of SEER registries in the USA) using the SEER definition of a second primary (Johnson et al., 2007) versus the IARC/IACR rules.

Registration of cancers in asymptomatic individuals

Incidental diagnosis is the incidental detection of cancer in an asymptomatic individual (e.g. upon microscopic examination of tissue that has been removed for a reason unrelated to cancer). The incidental diagnosis of cancer occurs with particular frequency as a result of screening examinations and at autopsy.

Screen-detected cancers

When a screening programme is introduced within a population, cancer incidence rates increase, because the programme identifies prevalent cancers that are detectable by the screening test but have not yet progressed to the stage where they begin to cause symptoms. After the initial rounds of screening, these prevalent cases have all been detected, so the incidence rate decreases, but usually not all the way to the pre-screening level, due to some degree of overdiagnosis. This phenomenon occurs when cases are detected that would otherwise not have been diagnosed during a person's lifetime, either because the cancer was so slow-growing that the individual would have died of another cause before the cancer was detected, or because the cancer was non-progressive and would never actually have become invasive. These cancers are sometimes called pseudodisease. Overdiagnosis can occur as a

Table 5.1. The percentage difference in crude and age-standardized incidence rates (at selected body sites) within the SEER (9 registries) 2003–2007 dataset when determined using the SEER rules for multiple primary tumours versus the IARC/IACR rules (2004)

Body site	Difference in incidence rates using the SEER rules vs the IARC/IACR rules (%)			
	Males		Females	
	Crude	Age-standardized	Crude	Age-standardized
Colon	4.5	4.2	4.5	3.7
Lung	1.7	1.7	1.9	1.9
Skin (melanoma only)	9.0	8.4	5.4	4.9
Breast	–	–	8.7	8.0
Testis	2.1	2.0	–	–
Kidney	2.8	2.9	2.1	2.2
All sites except skin	1.6	1.4	3.0	2.8

consequence of breast cancer screening, and it is even more common in prostate cancer screening. In both cases, screening (by mammography for breast cancer or by prostate-specific antigen [PSA] testing for prostate cancer) identifies small, slow-growing, latent tumours. Although many of these tumours would never have progressed to clinically significant cancer during the patient's lifetime, it is currently impossible to predict which of them will. Incidence rates are therefore elevated in screened populations. Mammography screening programmes typically target women within the age range of 50–74 years. Men may undergo PSA testing at any age, but it is more common among men aged more than 50 years.

Almost all cancer registries include malignant tumours that are detected during screening programmes or diagnosed on the basis of histological specimens taken from asymptomatic individuals in whom there was no clinical suspicion of cancer. The inclusion of these cases is likely to increase incidence rates, since at least some of the malignant cells identified in these ways would never have resulted in a clinical cancer diagnosis had they otherwise remained undetected.

Autopsy-detected cancers

Most cancer registries include cases identified during necropsy examinations of subjects in whom cancer had not been diagnosed (or perhaps even suspected) during life. The extent of the resulting inflation of incidence rates depends on the prevalence of necropsy examinations within the population. The impact is greatest in countries and regions with legislation that permits autopsies to be conducted for medical, scientific, or educational purposes without consent. However, such practices have generally been declining in most countries over recent decades.

Application of international standards in low- and middle-income settings

Cancer registries operating in low- and middle-income settings may face particular challenges to following international registration standards (Bray et al., 2014). For example, a lack of coverage by pathology laboratories or difficulty accessing diagnosis records reduces the percentage of microscopically verified cases, and results in postponement of the incidence date as determined according to the ENCR recommendations, which define the incidence date as the date of first histological or cytological confirmation of malignancy.

COMPLETENESS

Completeness – the extent to which all of the incident cancers occurring in the population are included in the registry database – is a very important aspect of data quality. The incidence rates calculated from registry data most closely approximate their true values within the population when maximum completeness is achieved (through the use of comprehensive case-finding procedures). The methods used in the editorial process for this volume to evaluate overall completeness are semiquantitative, in that they provide an indication of the degree of completeness of a given registry's database relative to those of other registries or over time.

The indices of completeness evaluated during the editorial process can be grouped into four categories:

- historical data:
  - the stability of incidence rates (the number of new cases) over time
  - a comparison of incidence rates in different populations
  - age-specific incidence curves
  - childhood cancer incidence rates;
- the proportion of cases microscopically verified (MV%);
- the mortality-to-incidence (M:I) ratio; and
- death certificate methods.

Duplicate registration of the same case should be avoided through careful attention to record linkage during the registration process. Because the datasets submitted for this volume contained individual anonymous patient identification numbers, it was possible for the editors to check for duplicates (and multiple primaries) according to the IARC/IACR rules (IARC, 2004). However, it was not possible to check for duplicates within a dataset using other data items,

which could only be assessed by the individual registries before submission.

Regional comparisons

For several of the quantitative indices described below, a comparison with standard values was performed. In most cases, the standard used for comparison was the values from cancer registries in the same region (or by country when the number of high-quality registries was sufficient), using the data published in the previous two volumes of CI5. Diagnostic practices (especially with respect to histology and cytology) and the accuracy of recording the underlying cause of death on death certificates vary between populations and regions, but it is reasonable to assume that the incidence rates for specific cancers will tend to be relatively similar in datasets from the same region. In total, 25 regions (or countries) were defined for the purpose of calculating the standard values used to support editorial decisions (see Table 5.2). For each regional group of registries, the data from CI5 Volumes VIII and IX were used to calculate the mean and variance of the site-specific age-standardized incidence rates, the MV%, and the M:I ratios. Tables listing some of the standard values of MV%, M:I ratio, and age-standardized rate per 100 000 (ASR) that were used in the CI5 editorial process (i.e. those calculated for low- or middle-income countries and regions) are provided in Annex 2 of IARC Technical Publication No. 43 (Bray et al., 2014).

Ad hoc tables were used to identify unusually high or low incidence rates in specific regions – both for all sites combined and for certain major cancers. This helped the editors to assess completeness, by allowing them to identify outliers or unusual patterns.

Historical data

Stability of the incidence rates (the number of new cases) over time

Changes in the completeness of registration may lead to the appearance of unexpected or implausible incidence trends within a registry's dataset. Therefore, one of the key CI5 editorial tables (see Editorial table 1 at the end of this chapter) lists the number of new cases registered by site per calendar year (and the corresponding percentage of the total number of cases), broken down by sex, with an accompanying bar chart that provides a visual check of the amount of variation in the total numbers of cases per year (at all sites and in both sexes) over the time period covered.

Table 5.2. The regions defined for calculating standard values of age-standardized incidence rates, proportions of cases microscopically verified (MV%), and mortality-to-incidence (M:I) ratios

		Number of registries in the region
Africa	Sub-Saharan Africa	4
	North Africa and West Asia	10
Central and South America	Central America and the Caribbean	4
	Brazil	5
	South America (excluding Brazil)	12
North America	Canada	10
	USA	13
Asia	China	11
	India	9
	Japan	7
	Republic of Korea	8
	Thailand	5
	Other countries in East Asia	7
Europe	Eastern Europe	7
	United Kingdom	12
	Northern Europe	8
	Italy	22
	Spain	11
	South-eastern Europe	8
	France	11
	Germany	7
	Switzerland	7
	Other countries in western Europe	6
Oceania	Australia and New Zealand	9
	Oceania (excluding Australia and New Zealand)	3

At the bottom of each bar, a percentage value indicates how many cases were registered that year relative to the highest number of cases registered in any single year of the covered period. In some cases, this visual check may suggest potential problems with the registration process (or the source population data) during the registration period.

Another editorial table (see Editorial table 3 at the end of this chapter), which is generated separately for males and females, presents average annual incidence rates (per 100 000 person-years) by site and age group, as well as summary rates. This table also includes a column (with the heading *CHV9*) that lists the estimated annual percentage change in the incidence rates since Volume IX of CI5, and the changes that are statistically significant are shown in bold. This comparison of the Volume IX and Volume X data, and other comparisons that were performed as part of the editorial process, are described in the *Statistical tests* section later in this chapter. Changes in incidence rates over time that are larger than expected (and that cannot be attributed to discrepancies in the estimation of person-years at risk) suggest the possibility of changes in the completeness of case ascertainment.

Comparison of incidence rates in different populations
The possibility of incomplete registration is also investigated by comparing observed incidence rates with expected values calculated using data from registries in the same region, and another editorial table is generated for this purpose (see Editorial table 4 at the end of this chapter). This table presents the age-standardized incidence rates (and their standard errors) for 21 sites (and the total for all sites) in males and females, along with the ratio of the observed value to the expected value (O/E). If the observed age-standardized rate is significantly different from the expected value for the corresponding country or region, the O/E is shown in bold and flagged with a greater-than symbol (>) if the value is higher than expected or a less-than symbol (<) if the value is lower than expected. This comparison and others that were performed as part of the editorial process are described in the *Statistical tests* section later in this chapter. In addition to consulting this editorial table, the editors also frequently compared ad hoc tabulations from registries covering geographically or ethnically similar populations. In some cases, deviation from regional standards may be the result of specific local variations in the prevalence and distribution of risk factors, or in the presence or intensity of screening for certain cancers, but systematic discrepancies (i.e. those seen for several different sites) suggest the possibility of underregistration (or overregistration – e.g. due to the inclusion of duplicate records).

Age-specific incidence curves
As part of the editorial process, age-specific incidence (per 100 000 person-years) curves for 12 sites by sex (see Editorial table 2 at the end of this chapter) were generated and examined to detect any abnormal fluctuations in the anticipated patterns, such as an unexpected drop in the rate of increase in incidence in older age groups, which may be indicative of underascertainment within these groups (although there can also be other explanations). These curves can also reveal problems with the source files used to determine the size of the populations at risk in the various age groups (see also the *Population* section later in this chapter).

Childhood cancer incidence rates
The incidence rates of cancer (all types combined) within children (i.e. within the age groups 0–4 years, 5–9 years, and 10–14 years) tend to exhibit much less variability than do the incidence rates of cancer in adults, although there are some well-documented geographical and ethnic differences for certain childhood cancers. The possibility of underenumeration (and duplicate registration) in this age range within the Volume X data was investigated by comparing incidence rates within the childhood age groups with the corresponding values from Volume IX. The lowest and highest deciles of incidence rates of childhood cancer in the Volume IX data are shown in Table 5.3.

Proportion of cases microscopically verified (MV%)
The MV% is the percentage of cases that were diagnosed on the basis of microscopic verification of a tissue specimen (sometimes also called morphological verification – the two terms are synonymous). The definition of microscopically verified cases includes histologically confirmed cases, cases diagnosed on the basis of exfoliative cytology specimens, and cases of leukaemia diagnosed on the basis of haematological examination (without examination of bone marrow). The main use of MV% as an indicator of data quality is as a measure of validity (see the *Validity* section later in this chapter), but a very high proportion of cases diagnosed by histology, cytology, or haematology – higher than might reasonably be expected – may also

Table 5.3. The lowest and highest deciles of incidence rates (per million) of childhood cancer in Volume IX

Age group (years)	Boys		Girls	
	Lowest	Highest	Lowest	Highest
0–4	< 13.7	> 25.6	< 11.3	> 23.2
5–9	< 8.9	> 16.5	< 7.0	> 12.7
10–14	< 9.2	> 16.3	< 7.9	> 14.9

suggest that a registry is overreliant on pathology laboratories as a source of information and is failing to find cases diagnosed by other means. One of the editorial tables discussed earlier in this chapter (see Editorial table 4 at the end of the chapter) also includes a column showing observed MV% values for 21 sites (and the total of all sites) in males and females. In this MV% column, any observed values that are significantly greater than or less than the expected value (an average for the corresponding country or region) are shown in bold and flagged with a greater-than symbol (>) or a less-than symbol (<), respectively. This comparison is also described in the *Statistical tests* section later in this chapter.

Mortality-to-incidence (M:I) ratio

The M:I ratio is an important indicator of completeness, and its use for this purpose is an example of the independent case ascertainment method of evaluating registry completeness. The M:I ratio compares the number of deaths due to a specific type of cancer over a specific period of time (obtained from a source that is independent of the registry – usually the vital statistics system) with the number of new cases of that type of cancer registered during the same period. When the quality of the mortality data is good (especially in terms of the accuracy of cause of death) and incidence and survival are in steady state, the M:I ratio is approximated by 1 minus the 5-year survival probability. Because both survival and the quality of mortality statistics are somewhat related to the level of socioeconomic development, it is important to consider a registry's geographical location when evaluating this statistic. As part of the CI5 editorial process, the observed M:I ratios for registries' datasets were compared to standard values from the same region, testing for significant differences (see the *Statistical tests* section later in this chapter). Editorial table 4 (at the end of this chapter) includes a column showing observed M:I ratios for 21 sites (and the total of all sites) in males and females. Within this column, any observed values that are significantly greater than or less than expected (based on the average regional values from Volume IX) are shown in bold and flagged with a greater-than symbol (>) or a less-than symbol (<), respectively.

M:I ratios that are higher than expected raise suspicion of incompleteness (i.e. incident cancers missed by the registry), especially if the values are high for several different sites. However, under- or overreporting of tumours on the death certificates distorts this relationship, as does a lack of constancy in incidence and case fatality (the rate of death among incident cases) over time. For example, if incidence increases while case fatality (or survival) remains relatively constant, the M:I ratio tends to be less than (1 minus survival); conversely, if incidence decreases relative to case fatality, the M:I ratio is greater than (1 minus survival), and may even exceed a value of 1 for more lethal cancers.

The use of this method requires mortality data that are of good quality, especially in terms of the accuracy of cause of death. This method cannot be used where there is no comprehensive death registration, or when cause of death is missing or inaccurate on death certificates, which is the situation in almost all countries in Africa and many countries in Asia.

Death certificate methods of evaluating completeness

Access to death certificates is important to cancer registries as a means of finding cases not captured by other registration procedures. The completeness of registration may be evaluated on the basis of the proportion of incident cancers that come to the registry's attention via death certificates. Fig. 5.1 illustrates the process of registering new cases using death certificates that mention cancer.

A cancer registry's record linkage procedures should enable the registry to accurately determine whether a death certificate case is already in the database (i.e. previously notified by and registered from another source). A death-certificate-notified (DCN) case is any case first notified by a death certificate. For some DCN cases, the registry later receives a separate notification (without needing to initiate trace-back procedures), and the case is consequently registered from this non-death-certificate source. Because it is possible (depending on registry procedures) for a death certificate mentioning cancer to be received before other relevant notifications (e.g. a pathology report), it has been suggested that registries should establish a suitable interval between receiving a first notification by death certificate and initiating a registration on the basis of this information. If no other notifications are received after this interval, trace-back procedures are initiated. Some cases that are successfully traced back may be found not to be cancers, and are therefore not registered. The remaining cases are classified as death-certificate-initiated (DCI) cases, of which there are two types: (1) successfully traced cases found to be cancers, which are consequently registered from the appropriate source, and (2) cases for which no information source other than a death certificate mentioning cancer can be found, which are consequently registered as death-certificate-only (DCO) cases.

DCO cases represent the residuum of the trace-back process; they are the remaining DCN cases for which no other information source could be obtained through any of the registry's trace-back procedures. By itself, therefore, the proportion of DCO cases (DCO%) is not an indicator of completeness of registration; a low DCO% may indicate efficient case finding or may result from the efficient trace-back of DCN cases. However, the proportion of DCI cases (DCI%) is always greater than or equal to the DCO% (see Editorial table 4 at the end of this chapter), so an elevated DCO% is suggestive of incompleteness.

Like other indicators, the DCO% must be interpreted in the context of local circumstances. In some developing countries, the quality of death certificates may be very poor, with many deaths erroneously attributed to cancer, and registries may have difficulty tracing these notifications back to a hospital capable of confirming (or contradicting) the death certificate statement.

Because death certificate methods rely on the availability of relatively high-quality (complete and

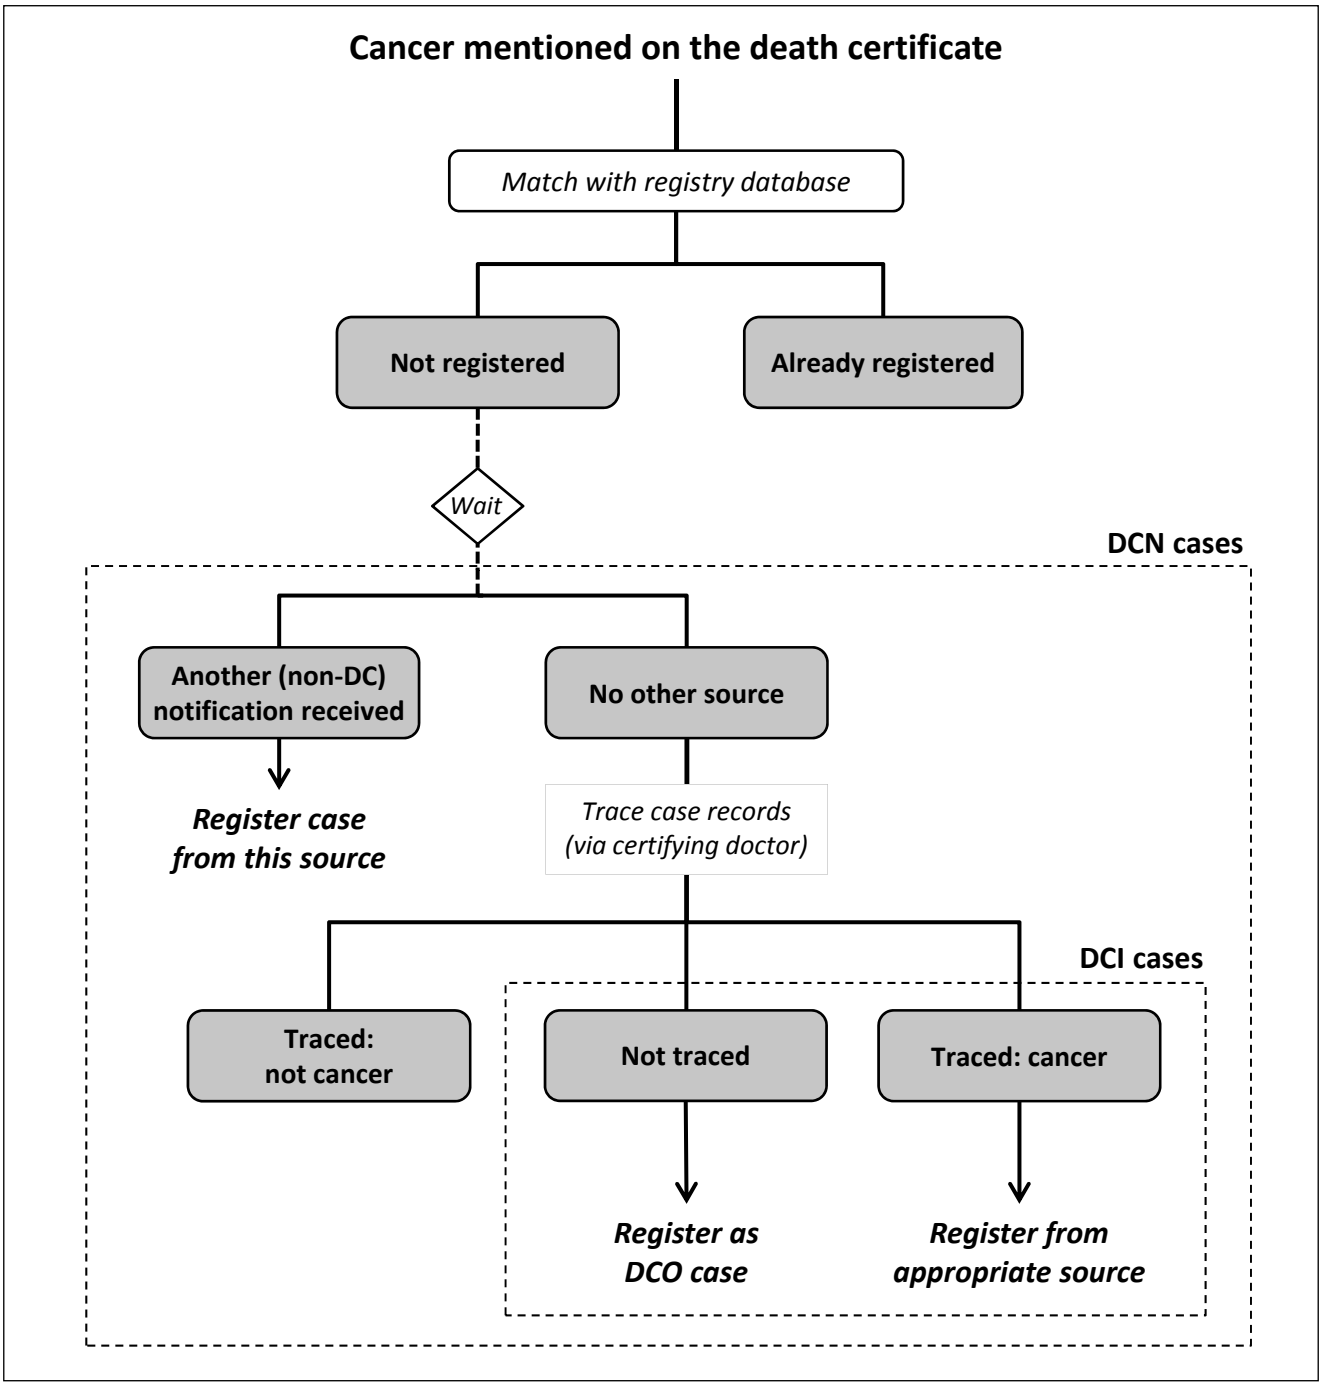

Fig. 5.1. The process of using death certificates (DCs) to identify new cancer cases, which may subsequently be classified as death-certificate-notified (DCN), death-certificate-initiated (DCI), or death-certificate-only (DCO) cases (see the chapter text for more details). Adapted from European Journal of Cancer, 45(5), Bray F and Parkin DM, Evaluation of data quality in the cancer registry: principles and methods. Part I: comparability, validity and timeliness, pages 747–55, Copyright 2009, with permission from Elsevier.

accurate) certification of cause of death within the registration area, they are not readily applicable in many low- and middle-income settings, or even in many high-income settings.

VALIDITY

Validity (or accuracy) is defined as the proportion of cases in a dataset recorded as having a given characteristic (e.g. site or age) that truly do have that attribute. Several linked methods are used in this volume to provide numerical indices of validity, which enable (at least on an interval scale) comparisons between registries, within a single registry over time, and within a single registry with respect to specified subsets of cases (cases at certain sites, from different sources, etc.). These methods include internal

consistency methods, diagnostic criteria methods (histological verification and DCO cases), and missing information analyses (e.g. primary site unspecified, age unknown).

Internal consistency

The use of the IARCcrgTools software to perform consistency checks on the submitted datasets is described in Chapter 6 of this volume. Registries were asked to verify and correct their data using this or other software tools before submission, and to ensure that the ICD-O-3 coding system was used for all relevant variables.

Microscopic verification

Typically, the accuracy of a stated diagnosis is likely to be better if the diagnosis is based on histological examination by a pathologist. However, surveys have shown that many cancer registries code diagnoses based on exfoliative cytology or haematological examination of peripheral blood in the same category as those based on histological examination (i.e. the cases are all coded as microscopically verified), making it is impossible to distinguish between them in the data. Partly for this reason, the index of validity used in the editorial tables (see Editorial table 4 at the end of this chapter) and the tables showing indices of data quality in this volume include the MV% rather than the proportion of cases histologically verified (HV%).

As noted in the *Completeness* section above, any observed MV% values in Editorial table 4 that are significantly greater than or less than expected (compared to the regional standard) are shown in bold and flagged with a greater-than symbol (>) or a less-than symbol (<), respectively.

Death-certificate-only (DCO) cases

The proportion of cancers for which no information other than a death certificate mentioning cancer can be found – the DCO% – is another measure of validity, since the information on death certificates is generally less accurate and/or precise than information obtained from clinical or pathology records. A considerable effort has been made in the editorial process to ensure that cases reported as DCO truly are DCO cases. As stated earlier in this chapter, DCO cases represent the residuum of the trace-back process; they are the remaining DCN cases for which no information other than a death certificate mentioning cancer could be obtained through any of the registry's trace-back procedures (see Fig. 5.1). Establishing acceptable and objective criteria for the DCO% has been a contentious issue in international comparative studies. As stated earlier, a low DCO% may simply reflect efficient trace-back of cases initially missed by the normal case-finding procedures. The DCO% is also influenced by local circumstances (including the availability and accuracy of death certificates) and the registry's ability to successfully link records.

Other and unspecified/age unknown

The proportion of registered cases with unknown values for various data items can be an indicator of data quality. Unknown values can result from problems with:

- the data collection system (or access to necessary source documents)
- the item and code values that are defined
- the application of coding rules.

The definitions used influence the proportion of unknown codes, for example, when evaluating cases with the primary site coded as "Other and unspecified" (O&U). This classification is defined in detail in Chapter 3. Other variables for which the proportion of cases with missing values is commonly evaluated include age, ethnicity, and disease stage. A high proportion of cases with missing values generally implies poor diagnostic precision (as evidenced by the low MV% observed among O&U cases) or a failure to specify the site of the primary cancer in cases diagnosed on the basis of tissue obtained from a metastasis. The proportion of unknown values usually varies by primary site and tends to be higher among elderly patients. The proportions also vary somewhat between registries. The percentages of O&U cases and cases with unknown age, by registry, are shown in Table 5.4 at the end of this chapter.

POPULATION

It is important to remember that a 10% error in the estimation of the population at risk produces the same level of inaccuracy in the calculated incidence rate as a 10% error in enumeration of cases. However, cancer registries are generally not responsible for population estimates, and must rely on official censuses, or intercensal/postcensal estimates provided by vital statistics departments or their equivalents. The editors asked all contributing registries to provide official population estimates and state the source of the population data. This information has been summarized for each entry, along with the average annual population at risk during the period covered by the registrations.

Although the population data provided by the registries could rarely be directly verified by the editors, the shapes of the population pyramids, as well as any irregularities in the age-specific incidence curves, were used to identify potential errors in the population estimates (see Editorial table 2 at the end of this chapter), and if necessary, the appropriateness of the source of the information provided was queried. Potential problems with estimating the population at risk are stated in the *Notes on the data* section of each entry. In some cases, a high likelihood of inaccuracy in estimates of the population at risk contributed to the editorial decision to mark a registry's contribution with an asterisk.

NOTES ON THE DATASETS: THE ASTERISKS (*)

The presence of an asterisk indicates that additional care is required in interpreting the numerical results for some or all cancer sites; readers should refer to the *Notes on the data* section of the corresponding registry description for the specific reasons. The principal use of the asterisks is to denote datasets that are considered by the editors to have characteristics suggesting questionable quality or completeness of

information on cases or the population at risk, as well as datasets for which the editors could not evaluate the relevant indices due to deficiencies in the registration process. The criteria used in this judgement were not rigidly defined; the decision was based on an examination of all the indices described in this chapter and knowledge of the circumstances within which the registry operates. The intrinsic value of a given dataset in providing information on little-known geographical and ethnic patterns, as well as continuity with earlier data from the same registry, were also taken into consideration. For the purpose of comparability between registries, all datasets for which no official mortality data could be provided or that included no DCO registrations (due to lack of access to death certificates) were also flagged with an asterisk.

STATISTICAL TESTS

Four comparisons (for which statistical tests were applied) were made as part of the editorial process for CI5 Volume X:

- a comparison of each age-standardized incidence rate with the corresponding value from Volume IX;
- a comparison of each registry's age-standardized incidence rates for major sites with the corresponding Volume IX values for registries in the same country or region;
- a comparison of each registry's MV% values for major sites with the corresponding Volume IX values for registries in the same country or region; and
- a comparison of each registry's M:I ratios for major sites with the corresponding Volume IX values for registries in the same country or region.

The results of these tests were not published but have been used to flag certain registry datasets as unusual or possibly inconsistent with previously published data, and therefore requiring further investigation. This battery of tests was first implemented in Volume VIII, and the methodological details and formulae are provided in Chapter 5 of that book (Parkin and Plummer, 2002).

Data compared with those from seven registries in the same region/country.
Significantly lower (<) or higher (>) values are shown in bold.

A detailed description of the statistical tests used can be found in the *Comparability and quality of data* chapter (page 72) of Volume VIII.

Chapter 6: Data processing

Jacques Ferlay, Eva Steliarova-Foucher, Sébastien Antoni, and Eric Masuyer

The call for data for Volume X of *Cancer Incidence in Five Continents* (CI5) was launched in September 2011, as described in Chapter 1. The call included detailed instructions about the content and format of the material to be submitted, and was disseminated to 596 identified cancer registries worldwide and posted on the website of the International Association of Cancer Registries (IACR). Registries wishing to submit data for inclusion in CI5 Volume X were asked to provide cancer incidence and mortality data, population data, a 350-word introductory text (narrative), a completed questionnaire, a coding schema, and other relevant information.

DATA FLOW

For this volume, CI5 data were collected semi-automatically for the first time. Registries were asked to submit all material via the Registries Portal, at a secure website (https://cinportal.iarc.fr/). The portal was developed as part of the EUROCOURSE project (http://www.eurocourse.org/), in collaboration with the National Cancer Registry Ireland and the Section of Cancer Surveillance (CSU) at IARC (Steliarova-Foucher et al., 2014). The portal is equipped with a series of programs that enable the automatic exchange of information between the cancer registries and CSU. Based on each registry's access credentials and the submitted data file type, uploaded files were automatically named and stored in an organized system of folders on an internal server at IARC. The submitting registry and the designated CSU staff members were notified of each submission by an automatically generated email. Throughout the process, the registries could review their submissions and manage their uploaded files at any time.

The portal was also used for communication between IARC and potential contributors during the editorial process. Requests for data correction or supplementary information, as well as decisions about registries' inclusion in the volume, were communicated through the portal. The relevant files were uploaded to the registry-specific *Feedback* section of the portal, where the registries could retrieve the files after being notified by an automatically generated email. The registries could then submit their responses and any revised or supplementary data in the same way as their initial material. A log of the files' movements on the IARC server was monitored by CSU.

Most of the invited registries submitted and exchanged data through the secured Registries Portal, but a few registries submitted zipped files by email. A schematic representation of the overall flow of data and processing steps is shown in Fig. 6.1.

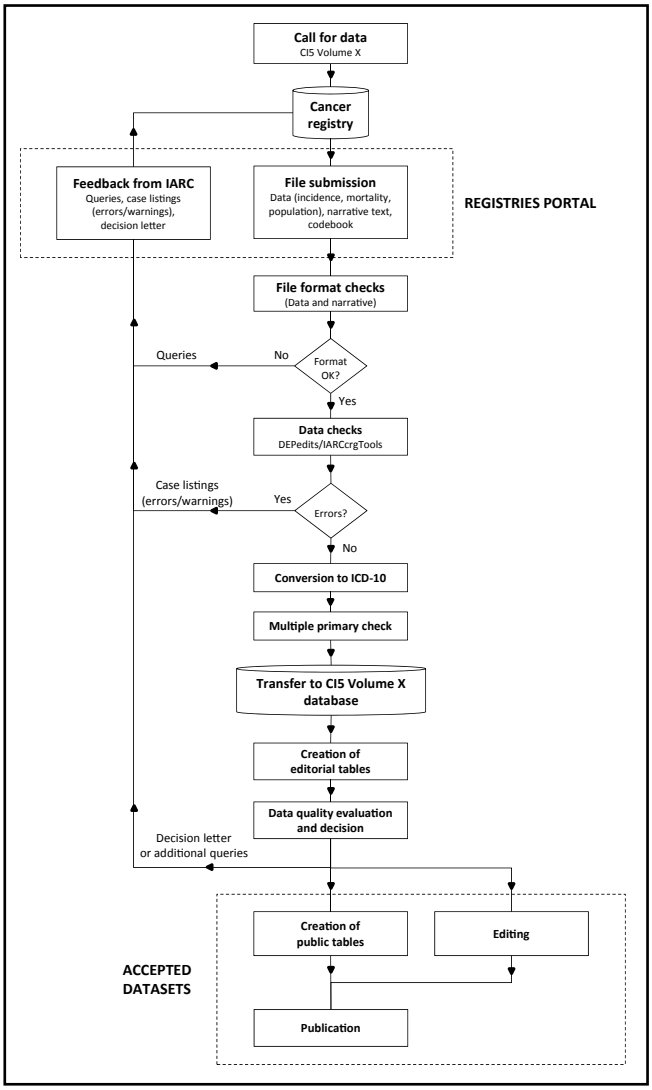

Fig. 6.1. A schematic representation of the overall flow of data and processing steps in the creation of Volume X of *Cancer Incidence in Five Continents*.

DATA PROTECTION

All raw, individual-level data collected for CI5 Volume X were stored on a secure protected server at IARC, to which only a limited number of selected CSU staff members had access. These data will not be used for any other purpose or transferred to any third party without the registries' explicit permission.

DATA PROCESSING

A total of 370 cancer registries submitted data in response to the invitation to participate in CI5 Volume X (see Chapter 1). Although the preferred file formats were specified in the study protocol, data were received in several electronic formats (text files, spreadsheets, database files, etc.), with varying layouts. The first step of data processing therefore included a quick check of the files' contents (sometimes resulting in a request for additional material), as well as some reorganization and formatting.

About 40 million individual cancer records were received and processed by IARC. Coupled with mortality files, preliminary datasets representing 545 populations (including various ethnic groups) were produced and reviewed by the editors (see Chapter 5). All submitted data were processed and checked by IARC using automated in-house processes based on standard measures of data quality.

The IARC software packages DEPedits and IARCcrgTools (Ferlay et al., 2005; available from http://www.iacr.com.fr/) were used to check and convert the data. All programs used to process, check, and convert the data and create the tables were written in Stata and C++. The thousands of tables produced during the editorial process for publication online and in this volume were generated in PostScript format and converted to PDF.

Incidence data

Registries were asked to submit their incidence data as individual anonymized case listings including all malignant tumours and non-malignant tumours of the bladder, collected for the longest period possible, and to include incident diagnoses for a minimum of 3 consecutive years within the period of 2003–2007. Each record contained at least the following variables:

1. A registration number that uniquely identified the patient
2. Sex
3. Ethnic group or race (optional)
4. Birth date and/or age at incidence date
5. Incidence date
6. Tumour site (topography)
7. Tumour morphology
8. Tumour behaviour
9. Most valid basis of diagnosis.

Descriptions of the codes used for each variable were also required. However, it was not unusual for code values not to match the descriptions provided, or for coding information to be missing. In such cases, the registry was asked for clarification and to provide the correct codes if necessary. This was particularly important for calculating the percentage of microscopically verified or death-certificate-only (DCO) cases, for evaluating the important indicators of data quality influencing the decision to include a dataset in the volume, and for determining the potential designation of data with an asterisk.

CONVERSION TO ICD-O-3

Although 96% of the registries (356/370) submitted data already coded to ICD-O-3 (Fritz et al., 2000), 16 datasets had to be converted to ICD-O-3 before they could be processed by the program. The alternative coding systems used were ICD-O-1 (WHO, 1976), ICD-O-2 (Percy et al., 1990), and sometimes combinations of ICD-9 (WHO, 1977) or ICD-10 (WHO, 1992) topography with ICD-O morphology. Conversion from ICD-9 or ICD-10 combined with ICD-O required partitioning of the original file into two or more files; each was then converted separately using the appropriate program, then merged. These preliminary conversions helped to detect incompatibilities between ICD-9 or ICD-10 codes and the ICD-O system. Any incompatible records were sent back to the registry for review and correction.

Although ICD-O-3 clearly states that behaviour codes /6 and /9 should not be used by cancer registries (ICD-O-3, p. 27), these codes did appear in a few datasets, casting doubt on the accuracy of the corresponding topography codes. Usually, the provided topography code was assumed to represent the site of the primary tumour. When this was evidently not the case (e.g. carcinomas in lymph nodes or bone), a list of such cases was sent back to the registry with a request for clarification. As a last resort, these cases were recoded to topography C80.9 (primary site unknown), the provided morphology code was retained, and the behaviour code was set to /3.

CHECKING

All datasets with complete ICD-O-3 coding of tumour site, morphology, behaviour (and optionally grade), and basis of diagnosis were run through the IARC-CHECK program included in the IARCcrgTools package, which performed the following checks:

1. Code verification
   - Sex
   - Incidence date (and birth date, if provided and complete)
   - ICD-O-3 topography, morphology, and behaviour

2. Consistency between items
   - Age versus birth and incidence dates
   - Sex versus site
   - Sex versus histology
   - Age versus site
   - Age versus histology
   - Site versus histology
   - Basis of diagnosis versus histology.

Registries submitting data for Volume X were invited to run their data through the IARC-CHECK program before submission, and a large number of contributors did so. The datasets of registries using CanReg software (available from http://www.iacr.com.fr/) were checked using the equivalent built-in functionalities. All datasets were rechecked by IARC staff. Any errors or unlikely or rare combinations of items were sent back to the registry for verification, unless they were already flagged as double-checked. The received corrections and resubmissions were then consolidated, converted if necessary, and rechecked to ensure that no further errors were found. More than

one cycle of data validation was required for many of the datasets.

MULTIPLE PRIMARIES

All records included a unique patient and tumour identification number, so it was possible to check for multiple primary tumours occurring in the same patient using the multiple primary check program included in the IARCcrgTools package. The software lists all sets of tumours recorded for a single patient that should be considered a single primary tumour according to the IARC/IACR rules specifically defined for ICD-O-3 (IARC, 2004). The longer the time period for which data were submitted, the more complete the identification of multiple primary tumours in the reference period of 2003–2007.

CONVERSION TO ICD-10

When no errors remained, the incidence data were converted from ICD-O-3 to ICD-10, to ensure that the ICD-10 categories resulted from the same conversion process (ICD-O-3 to ICD-10) for all cancer registries. The ICD-O-3 to ICD-10 conversion program was written at IARC and is based on the rules defined in *Conversion of Neoplasms by Topography and Morphology from ICD-O-2 to ICD-10* by Percy (1998). In summary, each new ICD-O-3 morphology code (as listed in Appendix 1 of ICD-O-3) was converted first to the closest ICD-O-2 morphology code using the ICD-O-3 to ICD-O-2 conversion program (Fritz and Ries, 2001), and then the corresponding ICD-O-2 to ICD-10 conversion rule was applied. For example, the ICD-O-3 code M8174/3 (Hepatocellular carcinoma, clear cell type) was converted to the ICD-10 code C22.0, following the rule that applies to the ICD-O-2 code M8170/3 (Hepatocellular carcinoma, not otherwise specified [NOS]).

The conversion rules strictly follow the ICD-10 coding rules expressed in the instruction manual of ICD-10 Volume 2 and the alphabetical index of ICD-10 Volume 3. For example, the combination of unknown primary site (ICD-O-3 topography code C80.9) and fibrosarcoma, NOS (ICD-O-3 morphology code 8810/3) was converted to ICD-10 code C49.9 (Connective and other soft tissues, NOS; see ICD-10 Volume 2, p. 74). The ICD-O-3 codes M995_, M996_ (myeloproliferative disorders [MPD]), and M998_ (myelodysplastic syndromes [MDS]), for which no ICD-10 code in the malignant C category exists, were converted to the ICD-10 codes D45, D46_, and D47_ (i.e. non-malignant tumours), respectively, and are included and presented in the tables under the categories MPD and MDS.

When a dataset was submitted with cases coded to ICD-10 for topography and ICD-O-2 for morphology, the conversion process sometimes produced ICD-10 codes different than those originally provided in the submitted file, as shown in Table 6.1.

In the example shown in Table 6.1, the final ICD-10 code is sex-specific and differs from the code provided in the original record. Generally, such changes in ICD-10 codes occurred when a registry did not strictly follow the rules in the ICD-O manuals; in the example shown in Table 6.1, Sertoli cell carcinoma (M8640/3) should have been coded to testis (C62.9) if the site of the tumour was not specified (rule 8 of ICD-O-2 or rule H of ICD-O-3). The ICD-10 code for unspecified site was recoded to skin (C43.9) or bone (C41.9) if the morphological diagnosis was malignant melanoma, regressing (M8723/3) or osteosarcoma (M9180/3), respectively. This example explains why the original ICD-10 codes provided (if any) were not used in the final tabulations.

For certain morphological codes, the conversion was independent of topography. For example, hepatocellular carcinoma (M8170/3) was automatically converted to the ICD-10 code C22.0, irrespective of the ICD-O topography code (whether specific or unknown). Thus, the combination of ICD-O-3 topography code C34.9 (lung, NOS) and morphology code 8170/3 was converted to ICD-10 code C22.0, because the original combination of topography and morphology was obviously incorrect. It was the detection of this kind of error that inspired the creation

Table 6.1. Conversions of datasets with cases coded to ICD-10 for topography (T) and ICD-O-2 for morphology (M)

Classification	Original coding	First conversion	Second conversion	Third conversion
ICD-10	C80 – Unknown primary			C62.9 – Testis, not otherwise specified (NOS)
ICD-O-2 (T)		C80.9 – Unknown primary		
ICD-O-2 (M)	8640/3 – Sertoli cell carcinoma	8640/3 – Sertoli cell carcinoma		
ICD-O-3 (T)			C80.9 – Unknown primary	
ICD-O-3 (M)			8640/3 – Sertoli cell carcinoma	

of the first version of the IARC-CHECK program, and these errors were detected during the checking process described earlier in this chapter.

MISCELLANEOUS CONVERSIONS

In addition to tumour topography and morphology, certain other variables (sex, basis of diagnosis, ethnic group or race, and dates) were also recoded to a common system according to the descriptions supplied by the registries. When necessary, the basis of diagnosis variable was recoded following the ICD-O-3 scheme, and for a few registries, the incidence dates required conversion to the Gregorian calendar. After conversion to a common dictionary, the incidence data corresponding to each registry were added to the CI5 Volume X database.

Mortality data

Together with their data on cancer cases, the registries were asked to provide official cancer mortality data for the reference period (2003–2007), ideally for each calendar year of the period. For the national cancer registries, mortality data were extracted from the WHO Mortality Database (http://www.who.int/healthinfo/statistics/mortality_rawdata/en/) by IARC staff. The mortality data were used for editorial purposes as an indicator of the completeness of registration. Because the data were generally provided in tabular form for the available ICD-9 or ICD-10 three-digit categories by sex and 5-year age group, only checks for the validity of the ICD code and the combination of sex and site were performed. The data provided by some registries were grouped into wider cancer sites or age groups than conventionally used, and therefore had to be reformatted before being processed by the series of editorial programs and added to the CI5 Volume X database. Some registries supplied mortality data based on the cancer registry dataset. Such data were not considered by the volume editors to represent official mortality data.

Population data

The registries were required to submit population denominators for each individual year of the reference period, by sex and 5-year age groups. In the absence of corresponding data sources, a population denominator for a single central year of the reference period was accepted. The population data were checked first by careful examination of the data file, then by comparing the age distribution with that from the previous CI5 volume, if available. Unexpected changes in the age structure or in the total population by year and sex were identified and queried. After examination, the population files were formatted and added to the CI5 Volume X database.

THE CI5 VOLUME X DATABASE

The CI5 Volume X database contains all the incidence, mortality, and population datasets supplied by the registries and checked by IARC for the project, irrespective of whether they were ultimately selected for inclusion in the volume itself. Incidence data were supplied for all malignant neoplasms, as well as non-malignant (except benign) neoplasms of the bladder. The data are stored as a listing of individual records (without patient identification numbers, which are no longer necessary) containing the eight compulsory variables, with topography and morphology coded to ICD-O-3 together with the corresponding ICD-10 code used for tabulation. The database is hosted and maintained on a protected server at IARC, with access restricted to identified CSU staff members.

CONCLUSION

The complete process of data checking and validation conducted by IARC in collaboration with the cancer registries took several months. The help provided by those contributors who converted and checked their data before submission was greatly appreciated. Although prompt data provision is of the utmost importance, this importance is counterbalanced by the necessity of validating and ensuring the comparability of the global cancer incidence data. Online publication of the data ahead of the printed version provided earlier public access to the results.

The data processing methods described in this chapter resulted in the standardization of the information provided, which allowed the CI5 editors to compare datasets within large defined geographical regions, as described in Chapter 5. The CI5 data validation processes contributed substantially to the overall quality and comparability of the data from all submitting registries, as well as to data harmonization, with the benefit extending beyond this publication.

Chapter 7: Age standardization

Freddie Bray and Jacques Ferlay

INTRODUCTION

Age is a key determinant of the risk of developing every type of cancer in all populations worldwide (Armitage and Doll, 1954). In addition, the age structures of the registry populations included in this volume vary widely. For these two reasons, any global comparisons of incidence rates must be made independent of the effects of age in order to be meaningful. This chapter briefly discusses the summary measures used for this purpose in the preparation of *Cancer Incidence in Five Continents* (CI5), allowing for comparisons of incidence across populations (within Volume X) and within the same population over time (across consecutive volumes).

In each of the previous nine volumes of CI5, we have emphasized that an age-specific examination of cancer incidence rates is an essential exploratory step in any comparative analysis, and Volume X is no exception. Graphical displays of age-specific rates may reveal possible artefacts in the data or provide insight into the biology and etiology of cancer in the population or populations under study. The online resources available at http://ci5.iarc.fr (and the graphical facilities within) allow for a visual inspection that complements the tabulated summaries in the published volume.

To compare incidence across multiple populations or time points, we require a summary measure that absorbs the schedule of age-specific rates in different registries and across time. The crude rate does not take into account the varying age structures in the underlying populations. Therefore, as in previous volumes, two standardized measures – the age-standardized rate and the cumulative rate – are presented; this enables comparisons of cancer risk between registries, independent of the effects of age.

A brief description of the properties of these summary measures is given below, together with the principal calculations involved. Readers who wish to explore the topic in more depth should consult the chapters by Smith (1992) and Day (1992) in CI5 Volume VI. The books by Jensen et al. (1991), Dos Santos Silva (1999), and Kirkwood and Sterne (2003) include chapters that discuss in practical terms the age standardization of cancer data, while Estève et al. (1994) give a more theoretical account of the underlying methodology.

CALCULATING AGE-STANDARDIZED RATES

The age-standardized incidence rate is the summary rate that would have been observed, given the schedule of age-specific rates, in a population with the age composition of some reference population, often called the standard population. Calculation of the standardized rate is an example of direct standardization, whereby the observed age-specific rates are applied (directly) to a theoretical standard population. The calculation is illustrated in Table 7.1, for lung cancer incidence among males in Haut-Rhin, France (2003–2007), using the world standard population first introduced by Segi (1960), drawn from a pooled population of 46 countries and modified for the first volume of this series by Doll et al. (1966). The Segi–Doll world standard is used in this and all previous volumes of CI5 as a means to rapidly examine geographical and temporal variations in cancer risk.

The main criticism levelled at age-standardized rates concerns the need to select an arbitrary standard population; age-standardized rates can only be meaningfully compared if they refer to the same standard. Although it is clear that the age composition of the world standard is representative of neither the present nor the future age-specific global population, switching to a more up-to-date standard would only be worthwhile if it could provide benefits that outweighed the drawbacks of rendering the Segi–Doll standardized rates obsolete. However, it has been shown that although very different absolute values of age-standardized rates are obtained using different standards, the estimates of age-adjusted relative risk (the main purpose of such routine comparisons) are quite similar (Bray et al., 2002). Therefore, the main effect of changing the standard to a more up-to-date representation of the global population would be the inconsequential result that the value of the age-standardized rate would be closer to that of the crude rate. Accordingly, for both theoretical and practical reasons, the age-standardized rates in this volume are calculated as previously, using the age composition of the Segi–Doll world standard, shown in Table 7.1.

Age groups are indexed by the subscript i, d_i is the number of cases in age group i, y_i is the number of person-years at risk in age group i, and w_i is the number of individuals in (or the weight of) age group i in the world standard population. The crude rate per 100 000 per year is therefore calculated as follows (using the data presented in Table 7.1 as an example):

$$10^5 \left(\sum_i d_i \right) \Big/ \left(\sum_i y_i \right) = 10^5 \times 1366/1815\,179$$

$$= 75.25$$

Table 7.1. Calculation of age-standardized incidence rates: lung cancer (ICD-10 C33–34), France, Haut-Rhin, males (2003–2007)

Age group (years) i	No. of cases d_i	Person-years at risk y_i	Age-specific incidence (per 10^5 years) $10^5(d_i / y_i)$	Standard world population w_i	Expected no. of cases in standard world population $d_i w_i / y_i$
0–4	0	116 393	0.00	12 000	0.00
5–9	0	117 111	0.00	10 000	0.00
10–14	0	118 902	0.00	9 000	0.00
15–19	0	122 085	0.00	9 000	0.00
20–24	0	113 482	0.00	8 000	0.00
25–29	0	112 071	0.00	8 000	0.00
30–34	0	129 930	0.00	6 000	0.00
35–39	2	143 815	1.39	6 000	0.08
40–44	15	144 361	10.39	6 000	0.62
45–49	78	137 093	56.90	6 000	3.41
50–54	134	133 354	100.48	5 000	5.02
55–59	168	116 645	144.03	4 000	5.76
60–64	175	85 151	205.52	4 000	8.22
65–69	212	73 461	288.59	3 000	8.66
70–74	258	64 321	401.11	2 000	8.02
75–79	204	47 399	430.39	1 000	4.30
80–84	99	26 865	368.51	500	1.84
85+	21	12 740	164.84	500	0.82
Total	1 366	1 815 179	75.25	100 000	46.78

And the age-standardized rate is calculated as follows:

$$\sum_i d_i w_i / y_i = 46.78$$

In this example, the age-standardized rate is 38% less than the crude rate in the same 5-year period. This is because the world standard population has proportionally fewer individuals in the older age groups than does the actual registry population, and the risk of disease (according to the age-specific rates) is higher at older ages.

CUMULATIVE RATE AND CUMULATIVE RISK

The cumulative rate is the sum of the age-specific rates over each year of age from birth to a defined upper age limit. Because age-specific incidence rates are usually computed for 5-year age intervals, the cumulative rate is then 5 times the sum of the age-specific rates calculated over the 5-year age groups, assuming the age-specific rates are the same for all ages within a 5-year age group. In the example of lung cancer incidence in males in the France, Haut-Rhin registry population, all the age groups are 5 years wide, so the cumulative rate from ages 0 to 74 is calculated as follows:

$$5\sum_i d_i / y_i = 5 \times 1208.41 \times 10^{-5}$$

$$= 0.0604$$

The cumulative rate is in fact not a rate at all but a dimensionless quantity most conveniently expressed as a percentage. In the example above, the cumulative rate up to the age of 74 years would be given as 6.04%.

The age span over which a rate is accumulated must be specified. In this volume, the age ranges 0–64 years and 0–74 years are used to provide two representations of the lifetime risk of developing the disease. Other age ranges may be more appropriate for more specific purposes, such as investigating childhood cancers.

The cumulative rate's companion – the cumulative risk – is defined as the probability that an individual will develop the disease in question during a certain age span, in the absence of other causes of death. If the cumulative risk in an age range is less than 10%, as is the case with most tumours, it can be approximated very well by the cumulative rate. Table 7.2 shows the correction needed to convert the cumulative rate into the cumulative risk. For values under 10%, the difference between the two is small. The precise mathematical relationship between the cumulative rate and the cumulative risk is as follows:

$$\text{cumulative risk} = 1 - \exp(-\text{cumulative rate})$$

Continuing with our example, the cumulative risk is 5.86%, and thus the estimated risk for a male in Haut-Rhin of developing lung cancer between the ages of 0 and 74 years is estimated as 5.9%. In other words, approximately 1 in 17 males would develop lung cancer in the defined region within the specified lifetime, assuming no other causes of death.

Table 7.2. Conversion of cumulative rates, 100*x*, into the corresponding cumulative risks, $100(1-e^{-x})$

100*x*	0.1	0.5	1.0	5.0	7.0	10.0	15.0	20.0	30.0	40.0	50.0
$100(1-e^{-x})$	0.1	0.499	0.995	4.88	6.76	9.52	13.93	18.13	25.92	32.97	39.35

The cumulative rate has two principal advantages over the age-standardized rate. First, because it is a form of direct standardization, the problem of choosing an arbitrary reference population is eliminated. Second, as an approximation of the cumulative risk, it has a greater intuitive appeal, and is more directly interpretable as a measurement of lifetime risk, assuming no other causes of death.

CALCULATING THE STANDARD ERROR

Both the age-standardized rate and the cumulative rate are weighted sums of the age-specific rates, so the standard error can be derived in both cases from the same formula. If the age-specific rate in age group i is estimated from d_i cases and y_i person-years, then the age-standardized rate (with w_i representing the standardization weights) is

$$\sum_i d_i w_i / y_i$$

with an estimated variance (based on the Poisson distribution) of

$$\sum_i d_i \left(w_i / y_i\right)^2$$

and an estimated standard error of

$$\sqrt{\sum_i d_i \left(w_i / y_i\right)^2}$$

For the age-standardized rate, the weights are given by the number of individuals in each age group per 100 000 in the standard population. For the cumulative rate, the weights are equal to the widths of the age groups. When all age groups are 5 years wide, the expression for the standard error (SE) of the cumulative rate (expressed as a percentage) reduces to:

$$\text{SE}\left(\text{cumulative rate}\right) = 500\sqrt{\sum_i d_i / y_i^2}$$

For the example of lung cancer in males in the France, Haut-Rhin registry population, the estimates (with standard errors) are 46.8 (1.31) for the rate standardized to the world population and 6.04 (0.19) for the cumulative rate (ages 0–74).

CASES OF UNKNOWN AGE

The age-standardized rate and the cumulative rate are necessarily corrected for cases of unknown age that occur within the CI5 registry datasets. The correction procedure involves multiplying the summary measure (based on cases of known age) by T/K, where T is the total number of cases of cancer of the same type in individuals of the same sex, and K is the number of cancers occurring in individuals of known age. The standard errors are also multiplied by the same correction factor (T/K).

This correction relies on the assumption that the cases of unknown age are randomly distributed, and therefore have the same age distribution as the cases of known age. In other words, the correction assumes that the probability that the age of a case is unknown does not depend on the age of the case. Although this assumption probably does not hold – it is more likely that age is not recorded among older patients – it is nevertheless important that all registered cases are accounted for, so that the summary statistics are not underestimated.

AVAILABILITY OF DATA FOR UPPER AGE GROUPS

The precision of rates calculated using direct standardization varies according to the number and width of the age groups used. Age-standardized rates, for example, yield slightly different values depending on the extent to which population data are available for the oldest age groups (aged 75 years or more). For most registries, census data are available for the same 18 age groups shown in Table 7.1, enabling the calculation of rates for the upper age ranges of 75–79, 80–84, and 85+. However, some registries can only obtain population data for 15, 16, or 17 age groups, and thus the oldest age groups instead correspond to individuals aged 70+, 75+, or 80+, respectively. As an example of the effect of this difference, the age-standardized rate of 46.8 for lung cancer incidence in males in the France, Haut-Rhin registry population changes to 47.3 when only 16 age groups are used in the calculation instead of all 18 age groups.

Chapter 8: Data availability and presentation

Eva Steliarova-Foucher, Jacques Ferlay, David Forman, Marion Piñeros, and Betsy Kohler

Since the beginning of the *Cancer Incidence in Five Continents* (CI5) series, the number of populations for which data are presented has increased dramatically, from just 34 populations in Volume I (Doll et al., 1966) to 424 populations in Volume X. As a result, the number of pages of the monograph has increased from 244 to more than 1400. The amount of information available about each population has also increased. Over the past five decades, data have progressively become available for more tumour types, data quality indicators have become more detailed and varied, and comparisons between registries have increasingly included descriptions of the registration techniques used. But the growing number of populations with data available for comparison has also necessitated a reduction of the variety of statistics presented for each registry in the printed publication. Fortunately, with the development and ever increasing accessibility of computer technology, data can now be provided online in much more detail than is possible in the printed version. Detailed data from the first eight volumes of CI5 were first published online in 2003 (Parkin et al., 2005), and online data from all 10 volumes are now available.

This chapter describes the information and data available in the printed version of CI5 Volume X, and provides guidance for accessing the information from CI5 online.

CI5 VOLUME X

CI5 Volume X provides data on cancer incidence for the period of 2003–2007, as well as pertinent information about the collection of these data. The volume is available in three formats: a printed scientific publication, a downloadable portable document file (PDF) (IARC, 2014a), and an online resource (see Table 8.1) (Forman et al., 2013; IARC, 2014b). The content of these three versions overlaps, although some material is unique to a specific format, as shown in Table 8.2 and described in the following subsections of this chapter.

Contributors

As in the previous volumes of CI5, a cumulative overview of contributing registries is provided in Chapter 1 of this printed volume. Each registry that contributed to any of the CI5 volumes is listed, along with the time period of incidence included in each volume. This allows readers to ascertain all the registries contributing to each individual volume, as well as the length of time a given registry has been contributing its data.

A similar overview can be found online, in the form of a map for Volume X under the *About* > *Contributors* menu option on the CI5 Volume X website, and as a list for each of the previous volumes under the *About* > *Cancer registry list* menu option on the CI5 Volumes I–X website.

Single registry entries

In all lists, the registries are sorted by alphabetical order in English: first by continent, then country name, then the name of the region within the country (if the registry is not national). The naming conventions used

for the geographical entities were guided by the United Nations standards (United Nations, 2012). Each population label includes the name of the country, the name of the region (if applicable), the name of the subpopulation (such as racial or ethnic group, if applicable), and the time period of data contribution. Registry-specific entries constitute the largest section, of approximately 800 pages, located in the middle of the printed publication.

Narratives
Each contributing registry provided a short text (limited to 350 words) describing the registration area, the population covered, the cancer care facilities, the data acquisition and processing techniques, the source(s) of population data, and other information useful for interpreting the data. Publications providing further details are also cited in this section. The narratives are included in this printed volume, and can also be downloaded as a component of the PDF version of the publication.

Population pyramids
For each population defined by a registry, a population pyramid is provided, showing the average annual person-years at risk during the reference period, for males and females, in 5-year age groups. The number of age groups depends on the age distribution of the population data provided. The horizontal bars of the pyramids represent the percentage contribution of each sex–age group to the total population. References to the population sources are provided. The population pyramids are presented in this printed volume, and are also included in the registry summary tables available for download online.

Cancer data
Based on the submitted data, the registry narratives are supplemented with tables showing the sex-specific age-standardized rates per 100 000 population observed in each registry area during the reference period for the 10 most common cancers, and for all sites combined.

In addition, a one-page overview table per population presents sex-specific statistics for all ages: the total number of cases, the percentage contribution of each cancer site to the total, and the incidence rates (crude and standardized rates per 100 000, and cumulative rates for the age ranges 0–64 and 0–74 years, expressed as percentages). The standardization is based on the world standard population (Segi, 1960), and the methods used are described in Chapter 7 of this volume. The cancer sites are arranged in ascending order of ICD-10 codes, which are displayed along with the site labels. Where applicable, these tables are provided for each subpopulation defined by the registry.

Detailed population-specific data are available exclusively online, under the heading *Tables (PDF) > Registry summary tables* on the CI5 Volume X website. In addition to the population pyramid and the one-page overview table described above, sex-age-specific incidence rates for 63 cancer sites, defined in Chapter 3, and the two combined totals of all cancers (including and excluding non-melanoma cancers of the skin) are tabulated on two pages, one for each sex. In addition to the statistics described above, these detailed tables include the numbers of cases with unknown age (if any) and the age-specific incidence rates for up to 18 age groups.

Asterisks
The entries for some registries or populations are marked by an asterisk preceding the registry label. This asterisk indicates that data comparability may be reduced for the reasons listed under the heading "Notes on the data" within the registry narrative. The procedure leading to such a designation is described in full in Chapter 5.

Comparative cancer incidence tables
The comparative incidence tables show incidence data for a single group of neoplasms across all populations included in the volume. Each comparative incidence table is sex-specific and spreads across four pages, listing the included populations vertically. There are three types of comparative cancer incidence table, differing by the definition of the presented neoplasms. Each set of tables is arranged in ascending order of ICD-10 codes; showing the aggregated totals first.

Summary tables by site (ICD-10 three-digit rubrics): The first set of tables shows all cancers combined (including and excluding non-melanoma skin cancers), the 63 three-digit (ICD-10) cancer sites described in Chapter 3, and the two grouped categories "Colorectal" and "Leukaemia". Each table for these categories shows sex-specific data for all ages combined, including the number of cases, the age-standardized incidence rate (using the world standard population), and the cumulative incidence rate for the age range 0–74 years. The rates are accompanied by their standard errors. As in the registry-specific tables, an asterisk preceding the registry label refers to the relevant registry-specific notes provided on the corresponding registry narrative page. These comparative tables run from page 918 to 1252 of the printed book, under the title *Age-standardized and cumulative incidence rates and standard errors*, and they are also available online under the heading *Tables (PDF) > Tables by site (3-digit category)* on the CI5 Volume X website. Chapter 3 provides an overview of the usage of international classifications (WHO, 1977; WHO, 1992; WHO, 1976; Percy et al., 1990; Fritz et al., 2000) for coding reported cancer diagnoses in cancer registries, as well as the inclusion rules of selected non-malignant neoplasms reportable by the contributing registries.

Summary tables by site (ICD-10 four-digit rubrics): The second set of tables has the same structure as the first, and shows data for detailed site categories (WHO, 1992), as listed in Table 8.3 at the end of this chapter. These categories can only be found online, and are accessible under the heading *Tables (PDF) > Tables by site (4-digit category)* on the CI5 Volume X website.

Summary tables by histological type: The third set of comparative tables shows data for histological

type groups for 15 selected cancer sites. These sex-specific tables list the total number of cases, the number of cases that were microscopically verified, and the age-standardized incidence rates for each defined histological group. Chapter 4 describes how the 15 selected cancer sites were divided into relevant histological type groups. These tables can be found online under the heading *Tables (PDF) > Tables by histological type* on the CI5 Volume X website.

Comparison of registration practices

Each submitting cancer registry completed a questionnaire describing their registration practices during the reference period of 2003–2007, as described in Chapter 2. The tabulated data include registry location, size of the population covered, year data collection began, reporting rules, data sources, data items recorded, and follow-up for vital status. These data are available online on the CI5 Volume X website under the *Techniques of registration* heading in two tables: *Registry background* and *Case finding and abstracting*. This information helps in the interpretation of the observed patterns of cancer incidence.

Indices of quality and comparability

All submitted datasets were subjected to computerized records checks and editorial review. The decision as to whether to include a given dataset in Volume X was largely based on the data quality indicators, such as percentage of microscopically verified diagnoses, percentage of cases reported from death certificates only, mortality-to-incidence ratios, age-specific and temporal distribution of cases, and other factors, as described in Chapter 5. Some of the data quality indicators are tabulated in Chapter 5 (e.g. the presence of active screening programmes). Other indicators are presented systematically for all registries in the site-specific tables titled *Indices of data quality* located at the end of the printed volume. The tables can also be found online under the *Tables (PDF) > Indices of data quality* menu option on the CI5 Volume X website. These tables were generated for 22 selected major sites or groups of cancer sites, as well as for the total of all sites combined. The indicators shown, for each sex, include number of cases, percentage of microscopically verified diagnoses [MV(%)], percentage of cases registered on the basis of death certificate only [DCO(%)], and mortality-to-incidence ratio [MI(%)] – the ratio of the number of cancer deaths to the number of cancer cases.

Online analysis

The CI5 Volume X website includes a heading for *Online analysis* routines, which can produce three types of output. The *Table by cancers* option lets users create a table showing the number of cases and the crude, age-standardized, and cumulative rates for each of the defined ICD-10 cancer sites, for a selected sex and age range (within the 18 five-year age groups) and a selected population or combination of populations. The results can be sorted by ICD-10 category or by any of the provided statistics. The *Table by populations* option lets users create a table showing the above-listed statistics for a single cancer site or a combination of cancer sites, for all populations included in Volume X or for the choice of continent(s) indicated by the user. The entire table is sex-specific, and users can restrict the age range and sort the results. The *Age-specific curves* option can provide up to 12 age-specific curves for a given population or combination of populations, tumour site or group of tumour sites, age range, and sex. Users can specify a title for the output graph (if more than one population or cancer is grouped), the line style, and other options. The underlying data used to generate the tables and graphs can be exported as comma-separated values (CSV) files.

CI5 VOLUMES I TO X ONLINE

The data of all 10 CI5 volumes are available online at http://ci5.iarc.fr/CI5I-X/. Under the *About* tab, the website provides an overview of the contributing cancer registries through the *Cancer registry list* menu option, an equivalence table of the cancer sites used in different periods through the *Cancer dictionary* option, *Notes* specific to the individual volumes, and other relevant information. Under the *Indices of data quality* tab, indices of data quality are tabulated for Volumes V to X according to principles similar to those already described for Volume X.

The *Online analysis* tab provides options for users to analyse the data published in all CI5 volumes, with outputs similar to those described for the specific CI5 Volume X website. One exception is age-specific data, which are displayed in the form of a table rather than a graph. Additionally, assessment of temporal trends is possible using the *Standardized rates by > Volumes* option, whereby the numbers of cases and incidence rates from all CI5 volumes can be tabulated for a selected cancer site, population, sex, and age range. The data from all generated tables can be exported to standard CSV files.

CI5*plus *SOFTWARE

CI5*plus* (Ferlay et al., 2014) provides online software to help users explore cancer incidence trends for registries that were included in at least three consecutive volumes of CI5, including Volume X. CI5*plus* contains updated annual incidence rates for 118 selected populations from 102 cancer registries published in CI5, for the longest period available (up to 2007), for all cancers and 27 major types.

CI5*plus* should be used in conjunction with the original CI5 publications, because differences over time in registration practices and changes in coding may influence the interpretation of the incidence time trends. A full description of this online system is provided in the publication accompanying the first release of CI5*plus* (Parkin et al., 2005).

CITING CI5 SOURCES

A new CI5 volume is published approximately every 5 years by the International Agency for Research on Cancer (IARC) in collaboration with the International Association of Cancer Registries (IACR). Each volume provides comparable high-quality cancer incidence data in the countries or regions where they are

collected. These data provide a baseline for generating knowledge of cancer causes and control. The online publication of the data enables any interested user to compare cancer rates across diverse populations.

CI5 is the fruit of collaboration among thousands of people worldwide over more than five decades. Its collaborators strive for common standards and a common cause. Without their hard work and dedication, this information would simply not be available.

The only reward expected by the CI5 collaborators is the acknowledgement of their efforts through the appropriate citation of these unique resources by all users, as shown in the following examples:

Table 8.3. ICD-10 categories used for the online display of the detailed site comparative tables

ICD-10 code	Short title used in tables	Full title
C01	Base of tongue	Malignant neoplasm of base of tongue
C02	Other parts	Malignant neoplasm of other and unspecified parts of tongue
C03	Gum	Malignant neoplasm of gum
C04	Floor of mouth	Malignant neoplasm of floor of mouth
C05	Palate	Malignant neoplasm of palate
C06	Other parts	Malignant neoplasm of other and unspecified parts of mouth
C07	Parotid	Malignant neoplasm of parotid gland
C08.0	Submandibular	Malignant neoplasm of submandibular gland
C08.1	Sublingual	Malignant neoplasm of sublingual gland
C08.8–9	Other & unspec.	Overlapping lesion of major salivary glands, major salivary glands, unspecified
C12	Piriform sinus	Malignant neoplasm of piriform sinus
C13	Other & unspec.	Malignant neoplasm of hypopharynx
C15.0,3	Upper third	Malignant neoplasm of cervical part/upper third of oesophagus
C15.1,4	Middle third	Malignant neoplasm of thoracic part/middle third of oesophagus
C15.2,5	Lower third	Malignant neoplasm of abdominal part/lower third of oesophagus
C15.8–9	Other & unspec.	Overlapping lesion of oesophagus, oesophagus, unspecified
C16.0	Cardia	Malignant neoplasm of cardia
C16.1	Fundus	Malignant neoplasm of fundus of stomach
C16.2	Body	Malignant neoplasm of body of stomach
C16.3	Pyloric	Malignant neoplasm of pyloric antrum
C16.4	Pylorus	Malignant neoplasm of pylorus
C16.5	Le. curv.	Malignant neoplasm of lesser curvature of stomach, unspecified
C16.6	Gr. curv.	Malignant neoplasm of greater curvature of stomach, unspecified
C16.8–9	Other & unspec.	Overlapping lesion of stomach, stomach, unspecified
C18.0	Caecum	Malignant neoplasm of caecum
C18.1	Appendix	Malignant neoplasm of appendix
C18.2	Ascend.	Malignant neoplasm of ascending colon
C18.3	Hepatic	Malignant neoplasm of hepatic flexure
C18.4	Transv.	Malignant neoplasm of transverse colon
C18.5	Splenic	Malignant neoplasm of splenic flexure
C18.6	Descend.	Malignant neoplasm of descending colon

Table 8.3. (Contd) ICD-10 categories used for the online display of the detailed site comparative tables

ICD-10 code	Short title used in tables	Full title
C18.7	Sigmoid	Malignant neoplasm of sigmoid colon
C18.8–9	Other	Overlapping lesion of colon, colon, unspecified
C19	Rectosigmoid junction	Malignant neoplasm of rectosigmoid junction
C20	Rectum	Malignant neoplasm of rectum
C21.0–2	Anus	Malignant neoplasm of anus, anal canal and cloacogenic zone
C21.8	Anorectum	Overlapping lesion of rectum, anus and anal canal
C23	Gallbladder	Malignant neoplasm of gallbladder
C24.0	Extrahepatic duct	Malignant neoplasm of extrahepatic bile duct
C24.1	Ampulla of Vater	Malignant neoplasm of ampulla of Vater
C24.8–9	Other & unspec.	Overlapping lesion of biliary tract, biliary tract, unspecified
C30.0	Nasal cavity	Malignant neoplasm of nasal cavity
C30.1	Middle ear	Malignant neoplasm of middle ear
C31.0	Maxillary sinus	Malignant neoplasm of maxillary sinus
C31.1–3	Other sinuses	Malignant neoplasm of other parts of sinuses
C31.8–9	Overlap. & unspec.	Overlapping lesion of accessory sinuses, accessory sinuses, unspecified
C33	Trachea	Malignant neoplasm of trachea
C34.0	Main bronchus	Malignant neoplasm of main bronchus
C34.1	Upper lobe	Malignant neoplasm of upper lobe, bronchus or lung
C34.2	Middle lobe	Malignant neoplasm of middle lobe, bronchus or lung
C34.3	Lower lobe	Malignant neoplasm of lower lobe, bronchus or lung
C34.8–9	Other & unspec.	Overlapping lesion of bronchus and lung, bronchus and lung, unspecified
C37	Thymus	Malignant neoplasm of thymus
C38.0	Heart	Malignant neoplasm of heart
C38.1–3	Mediastinum	Malignant neoplasm of mediastinum
C38.4	Pleura	Malignant neoplasm of pleura
C38.8	Overlapping	Overlapping lesion of heart, mediastinum and pleura
C40.0	Upper, long	Malignant neoplasm of scapula and long bones of upper limb
C40.1	Upper, short	Malignant neoplasm of short bones of upper limb
C40.2	Lower, long	Malignant neoplasm of long bones of lower limb
C40.3	Lower, short	Malignant neoplasm of short bones of lower limb
C40.8–9	Other & unspec.	Overlapping lesion of bone and articular cartilage of limbs, bone and articular cartilage of limb, unspecified
C41.0	Skull & face	Malignant neoplasm of bones of skull and face
C41.1	Mandible	Malignant neoplasm of mandible
C41.2	Vertebral column	Malignant neoplasm of vertebral column
C41.3	Ribs etc.	Malignant neoplasm of ribs, sternum and clavicle
C41.4	Pelvic bones	Malignant neoplasm of pelvic bones, sacrum and coccyx
C41.8–9	Other & unspec.	Overlapping lesion of bone and articular cartilage, bone and articular cartilage, unspecified

Table 8.3. (Contd) ICD-10 categories used for the online display of the detailed site comparative tables

ICD-10 code	Short title used in tables	Full title
C43.0–4	Head	Malignant melanoma of lip, eyelid, ear and external auricular canal, face and scalp and neck
C43.5	Trunk	Malignant melanoma of trunk
C43.6	Upper limb	Malignant melanoma of upper limb, including shoulder
C43.7	Lower limb	Malignant melanoma of lower limb, including hip
C43.8	Overlapping	Overlapping malignant melanoma of skin
C43.9	Unspecified	Malignant melanoma of skin, unspecified
C46.0	Skin	Kaposi sarcoma of skin
C46.1	Soft tissue	Kaposi sarcoma of soft tissue
C46.2	Palate	Kaposi sarcoma of palate
C46.3	Lymph nodes	Kaposi sarcoma of lymph nodes
C46.7	Other	Kaposi sarcoma of other sites
C46.8	Multiple	Kaposi sarcoma of multiple organs
C46.9	Unspecified	Kaposi sarcoma, unspecified
C47	Peripheral nerves	Malignant neoplasm of peripheral nerves and autonomic nervous system
C49	Connective and soft tissue	Malignant neoplasm of other connective and soft tissue
C57.0	Fallopian tube	Malignant neoplasm of fallopian tube
C57.1–4	Uterine adnexa	Malignant neoplasm of broad and round ligaments, parametrium and uterine adnexa, unspecified
C57.7	Other specified	Malignant neoplasm of other specified female genital organs
C57.8–9	Overlap. & unspec.	Overlapping lesion of female genital organs, female genital organ, unspecified
C70	Meninges	Malignant neoplasm of meninges
C71	Brain	Malignant neoplasm of brain
C72.0–5	Cranial nerves	Malignant neoplasm of spinal cord and other and unspecified cranial nerves
C72.8–9	Other & unspecified	Overlapping lesion of brain and other parts of central nervous system, central nervous system, unspecified

THE NARRATIVES

Algeria, Sétif

REGISTRATION AREA

Sétif is a province in the Arab-Islamic North African country of Algeria. The Sétif Population-based Cancer Registry (SPCR) covers the population of 20 *dairates*, which comprise a total of 60 communes, spread over an area of 6549.64 km^2. At the most recent national census (2008), the population was 1.5 million, constituting 4.7% of the overall Algerian population and making Sétif the country's second-most populated area, after Algiers. The area's population is relatively young (with 63% of residents aged less than 30 years and only 6.4% aged 60 years or more), and 52% of residents live in urban areas.

CANCER CARE FACILITIES

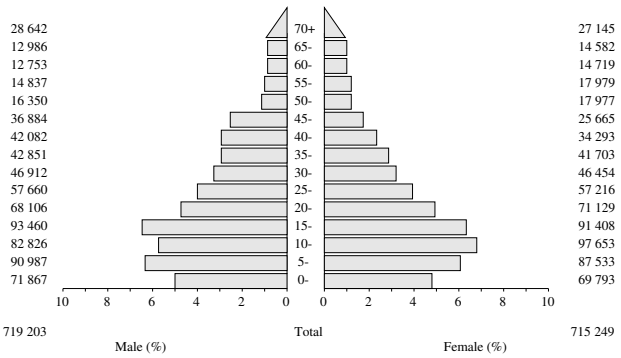
General health care in the region is predominantly provided by the University Hospital Centre (CHU), 10 other hospitals, 60 health centres, and 213 primary care centres. These are supplemented by private practitioners and hospitals, for a total of 2359 beds. Cancer patients are currently referred to the Anti-Cancer Centre (CAC) of Constantine and the Pierre and Marie Curie Centre (CPMC) of Algiers, but a new cancer centre is currently being implemented in Sétif.

REGISTRY STRUCTURE AND METHODS

The SPCR, founded in 1989, is located in the department of epidemiology of Sétif University Hospital, and is staffed full-time by six physicians. The registry uses active case finding from 16 data sources consisting of public and private hospitals, laboratories, insurance offices, other cancer registries, and death registration offices. SPCR staff members also regularly visit hospitals outside the registration area to collect information about resident cases treated outside the covered area. For each patient, data from multiple sources are cross-checked before registration.

INTERPRETING THE RESULTS

Algeria has national screening programmes in place for cervical and breast cancers, and a tobacco control programme is in preparation. Death registration is incomplete.



USE OF THE DATA

The registry has released a report on cancer incidence trends from 1986 to 2008. It has also participated in many international publications, such as *Cancer Incidence in Five Continents* (Volumes VI, VII, and IX), *Cancer in Africa: Epidemiology and Prevention*, and *International Incidence of Childhood Cancer* (Volume II). The registry was involved in the CONCORD study on survival estimates for colorectal, breast, and prostate cancers between 1990 and 1994, and is currently participating in the CONCORD-2 study.

*See note following population pyramid

Egypt, Gharbiah

REGISTRATION AREA

The Gharbiah Population-based Cancer Registry (GPCR) covers the population of the eight districts within the Gharbiah Governorate (Tanta, Elmahalla Elkobra, Kafr Elzayat, Zefta, Kotour, Elsanta, Basyoun, and Samannoud), in the Nile Delta region of Egypt. At the most recent census (2006), the population was 4 million, accounting for 5.5% of the overall population of Egypt. About 30% of residents live in urban areas.

CANCER CARE FACILITIES

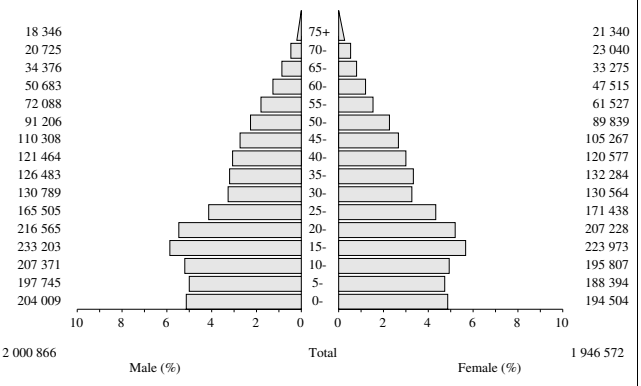
Patients suspected to have cancer are referred by primary and secondary care facilities to hospitals within Gharbiah (Tanta Cancer Center [TCC], Gharbiah Cancer Society, Tanta University Hospitals, insurance hospitals, and private hospitals) or outside Gharbiah (Mansoura Urology Center; Mansoura Gastroentrology Center; Clinical Oncology Department and Oncology Center, Mansoura University; National Liver Institute, Menoufeya University [40 km from Gharbiah]; National Cancer Institute, Cairo; and Children's Cancer Hospital Egypt [100 km from Gharbiah]).

REGISTRY STRUCTURE AND METHODS

The registry is located within TCC, and is sponsored by the Middle East Cancer Consortium, the United States National Cancer Institute in Bethesda, USA, and the Egyptian Ministry of Health and Population. The registry is staffed by a principal investigator, an executive director, two coinvestigators, a data manager, six part-time registrars, and five full-time secretaries. The GPCR uses active case finding from 63 data sources. Data quality is regularly assessed by senior registry staff members, CanReg4 software checks, and external auditing by staff members from Emory University, the SEER Program, and IARC. Registry data are protected with secure passwords, and access is granted to authorized personnel only.

INTERPRETING THE RESULTS

The physical area covered by the registry remains the same despite the increased population. The full range of diagnostic and treatment facilities available means that relatively few cases are missed, except among undiagnosed elderly patients in rural areas. TCC has established early detection programmes for breast, liver, and cervical cancers. Liver cancer is the most common cancer in the area, likely due to the high prevalence of hepatitis C virus infection. Bladder cancer is the second-most common cancer, with smoking likely to be the main risk factor.



USE OF THE DATA

The registry prepares an annual report on cancer incidence, highlighting trends and changes. Specific studies on epidemiology and survival of registered cancer cases have also been carried out.

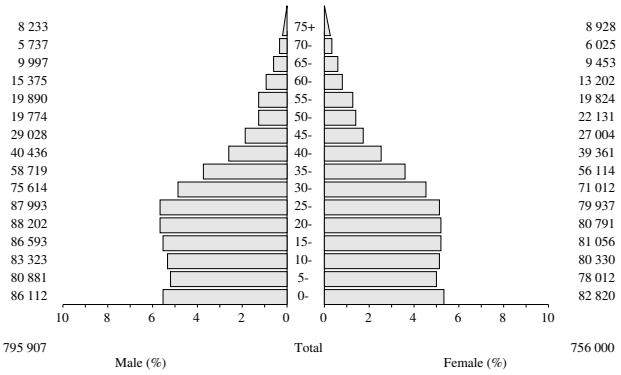
§Includes 2 cases of unknown age

Libya, Benghazi

REGISTRATION AREA
The Benghazi Cancer Registry (BCR) was established in 2002 and covers eight districts in the eastern part of Libya (Tobruk, Derna, Bayda, Al Marj, Benghazi, Ajdabiya, Al Wahat, and Al Kufra). At the most recent census (2006), the population of the area was 1.6 million (28% of the total population of Libya).

CANCER CARE FACILITIES
Cancer care services in the region are predominantly provided by the adult oncology and haematology units of Aljumhuria Hospital, the radiotherapy unit of the Benghazi Radio Diagnostic and Therapeutic Center, and the paediatric oncology and haematology unit of the Children's Hospital, which are all based in Benghazi. All cancer patients from the region are referred to these units.



REGISTRY STRUCTURE AND METHODS
The registry is located within the Medical School of Benghazi University and is staffed by a director, a scientific board, five coinvestigators and field supervisors, a data entry manager, and four part-time registrars. The BCR uses active case finding from various data sources, including cancer service units, general and regional hospitals, university hospitals, private hospitals and clinics, specialized hospitals and centres outside the region, and pathology and haematology laboratories. Death certificates are actively investigated. The staff of the Modena Cancer Registry (MCR) in Italy contributed to the training of the BCR registrars in coding techniques and in the use of software developed by the MCR.

INTERPRETING THE RESULTS
The BCR has made data on cancer incidence in eastern Libya available for the first time, and confirmed that the incidence is much lower than in more industrialized countries. Moreover, the observed patterns indicate that the incidences of many cancers, including those of the lung, breast, colon, rectum, and bladder, are in fact quite different from previous estimates based on data from neighbouring countries.

USE OF THE DATA
The registry prepares an annual report on cancer incidence, highlighting trends and changes. The data are made available to the Department of Health to help guide planning of cancer services. Some BCR data will also be used in future research projects.

Malawi, Blantyre

REGISTRATION AREA

The Malawi Cancer Registry (MCR) was established in 1989 by the Malawian Ministry of Health. It was a hospital-based registry until 1993, when IARC started supporting the current population-based registry. This support lasted until 2007, when the MCR began to receive funding from the Ministry of Health, local research teams, and the local WHO office.

CANCER CARE FACILITIES

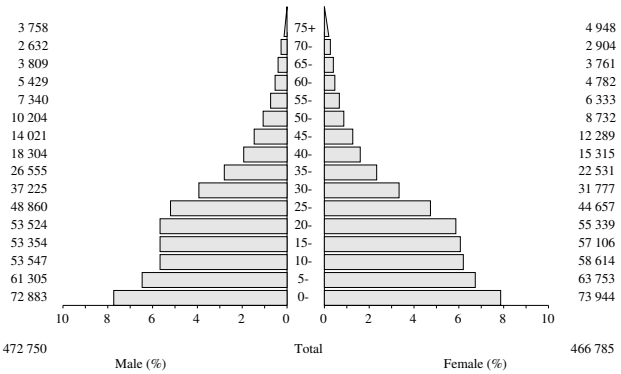
The Blantyre population is served by a 1000-bed national referral hospital (Queen Elizabeth Central Hospital [QECH]), which has modern diagnostic facilities, including magnetic resonance imaging, and dedicated oncology wards with adequate staffing at all levels. There are 14 other hospitals serving the Blantyre urban and rural catchment population, and three histopathology laboratories. Chemotherapy is available, but there are no radiotherapy facilities yet. The country's national cancer control plan is currently in the draft stage.

REGISTRY STRUCTURE AND METHODS

The MCR is physically located within the QECH complex, and is permanently staffed full-time by a cancer registrar and two data clerks, all of whom are employees of the Malawian Ministry of Health. The MCR's part-time staff members are the registry director and an assistant registrar (a histopathologist and a nurse, respectively). Active data collection methods and data management systems are used as per IARC guidelines. CanReg software is used for data management. The completeness of registration is currently undergoing formal validation through student projects at the University of Michigan, USA.

INTERPRETING THE RESULTS

The physical area covered has not changed since 1989, although there has been a population shift from rural to urban. Researchers often visit for short periods to study particular cancers, such as those of the oesophagus and breast, Burkitt lymphoma, and various leukaemias. These projects tend to cause spikes in the incidence trends for these cancers. There is a national screening programme for cervical cancer. The official prevalence rate for HIV infection has decreased from 14.5% in 2005 to 12%.



USE OF THE DATA

Incidence data and the extent of disease are reported and used for research projects, in training of medical and nursing students, and as a source of information for government policy-makers.

Malawi, Blantyre (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on the 1998 and 2008 national censuses carried out by the National Statistical Office of Malawi, making allowances for births and deaths. It was not possible to estimate migration into and out of the registration area.

NOTES ON THE DATA

*No official mortality data. No DCO registrations.

South Africa, PROMEC

REGISTRATION AREA

The PROMEC Cancer Registry has been operating for more than 20 years in the rural Transkei region of the South African province of the Eastern Cape. In its present form, the registry covers the population of eight magisterial areas: Butterworth, Centane (Kentani), Idutywa, Nqamakwe, Willowvale, Bizana, Flagstaff, and Lusikisiki. The vast majority of residents are Black Africans who speak isiXhosa and support both Christian and traditional norms and values.

CANCER CARE FACILITIES

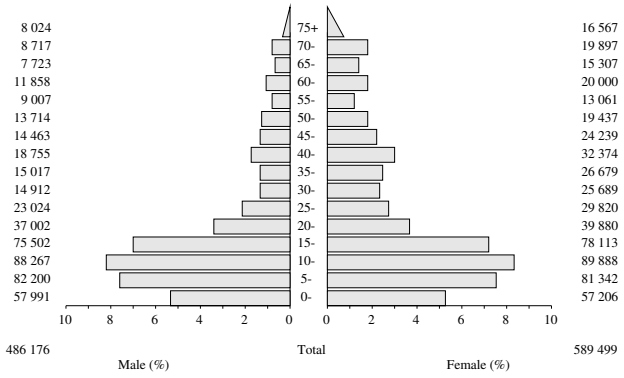
The area's health care delivery system is based on a network of government-run primary health care clinics and hospitals (with an emerging district management), and supplemented by private practitioners and hospitals. Basic laboratory services are available in most centres. Patients suspected to have cancer are referred by primary and secondary care facilities to specialized oncology and radiotherapy services. The government provides transportation to these hospitals for cancer patients.

REGISTRY STRUCTURE AND METHODS

The registry is funded mainly by the South African Medical Research Council (MRC) and receives additional funding from the Cancer Association of South Africa (CANSA). The registry employs eight staff members: a full-time senior scientist (who heads the registry), a full-time data manager, and six part-time oncology nurses (who collect data). An advisory committee provides expert advice to the registry. The PROMEC Cancer Registry collaborates with 19 hospitals and one state laboratory. Case finding is performed both passively and actively. All malignant cancer cases, including those of uncertain or unknown primary site, are registered.

INTERPRETING THE RESULTS

The registry has made special efforts to develop collaborative relationships with various health facilities within and outside the registration area. It is not currently possible to estimate the percentage of cancer cases that are missed by the registry.



USE OF THE DATA

The PROMEC Cancer Registry prepares annual reports on cancer incidence, including trends and changes. The registry is the main source of cancer information for policy-makers in the provincial and national health departments, as well as for researchers.

CONTRIBUTORS

Nontuthuzelo I.M. Somdyala
Wentzel C.A. Gelderblom
Debbie Bradshaw
Walter F.O. Marasas
Hester F. Vismer

South Africa, PROMEC (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on the 2001 population census, making allowances for births and deaths. It was not possible to estimate migration into and out of the registration area.

NOTES ON THE DATA

*No official mortality data. No DCO registrations.

Tunisia, North

REGISTRATION AREA

The Cancer Registry of North Tunisia (RCNT) covers the northern area of the country (28 162 km^2), which includes the country's capital city of Tunis and 11 *wilayas* (provinces). The covered area includes important urban regions such as the coastal cities of Tunis, Bizerte, and Nabeul, where commercial, industrial, and touristic activities are significant. Farming and fishing are the main occupations in the rural areas of the region, which are among the most fertile in the country. The region is mainly Arabic, and Islam is the professed religion of 99% of the population.

CANCER CARE FACILITIES

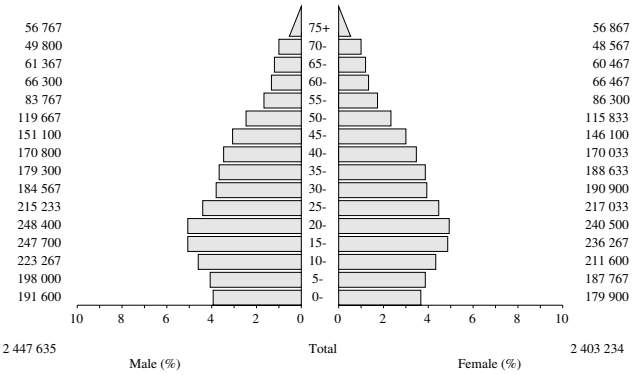
An important network of health substructures has been planned for the whole territory using health centres and programmes of primary care. In North Tunisia, 15 university hospitals and 11 non-university hospitals (one in each *wilaya*) provide support for cancer patients. About 40% of cancer patients diagnosed in North Tunisia are treated at the national cancer centre Institut Salah-Azaïz. Radiotherapy is available at one hospital and four private radiotherapy centres. More than 60% of the population of North Tunisia is enrolled in the country's public health insurance system (the Caisse Nationale d'Assurance Maladie).

REGISTRY STRUCTURE AND METHODS

The RCNT was officially founded in 1997, and is subsidized by the Tunisian Ministry of Public Health. The registry employs two physicians, three full-time clerks, and four or five part-time physicians. The RCNT collects data actively from 85 sources of public and private pathology and medical records. A large proportion of the staff's time is devoted to the search for duplicate registrations, which is performed at the time of data entry and on a regular basis using computer software. The RCNT ensures data security and confidentiality, and informs patients as required by Tunisian law.

INTERPRETING THE RESULTS

All types of invasive and in situ tumours are registered (including basal and squamous cell skin cancer). Benign tumours of the brain and superficial tumours of the urinary bladder were not registered during this reporting period.



USE OF THE DATA

The RCNT prepares periodic reports approximately every 3 years. More specific studies have also been carried out.

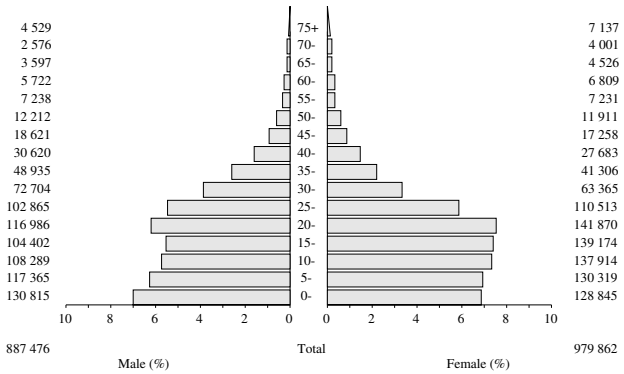
Uganda, Kyadondo County

REGISTRATION AREA
The Kampala Cancer Registry covers the population of Kyadondo County, which includes the city of Kampala (the capital of Uganda) and a peri-urban area extending approximately 30 km to the north. The majority of residents are members of the Ganda ethnic group.

CANCER CARE FACILITIES
Kyadondo County is served by the 1500-bed Mulago National Referral Hospital, which is equipped with modern diagnostic facilities. An oncology unit (the Uganda Cancer Institute) provides chemotherapy for various types of cancers, and the hospital has a department of radiotherapy (one of only two in the country). The city of Kampala has three moderate-sized mission hospitals with about 200 beds each. There are two hospital histopathology departments and three private histopathology laboratories. Palliative and end-of-life care services are provided by the Uganda Hospice.



REGISTRY STRUCTURE AND METHODS
The registry is situated in the Department of Pathology at the Makerere University College of Health Sciences, and has recruited personnel to assist in coordinating data collection. Submission to the registry is voluntary and infrequent, as cancer is not a reportable disease in Uganda. Registration is therefore almost entirely active. Registration visits to hospitals, hospices, and histopathology laboratories are carried out at least once a month, during which the hospital records – including admission and discharge registers, clinical notes, and pathology reports – are consulted. For each cancer case, both demographic and cancer diagnostic data are recorded. Death certificates are incomplete and therefore not used as a source of information by the registry. The registry is computerized, and data management is carried out using CanReg software, which includes checks for consistency and validity and facilitates the search for potential duplicate registration.

INTERPRETING THE RESULTS
In 2001, the completeness of registration was determined to be about 90% for adult cancer cases.

USE OF THE DATA
The registry provides the longest time series of cancer incidence in Africa. This makes the data of special value for cancer surveillance and research, particularly for monitoring the epidemic of HIV/AIDS and as a baseline for analytical studies and intervention studies.

Uganda, Kyadondo County (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION
Based on 2002 national census data and 2007 estimates for the city of Kampala, from the Uganda Bureau of Statistics (UBOS). The estimates for 2003–2007 assume a constant rate of growth within age groups between 2002 and 2007. The same methodology and growth rates were applied to derive 2003–2007 estimates for the non-urban area of Kyadondo County.

NOTES ON THE DATA
*No official mortality data. Limited DCO registrations.

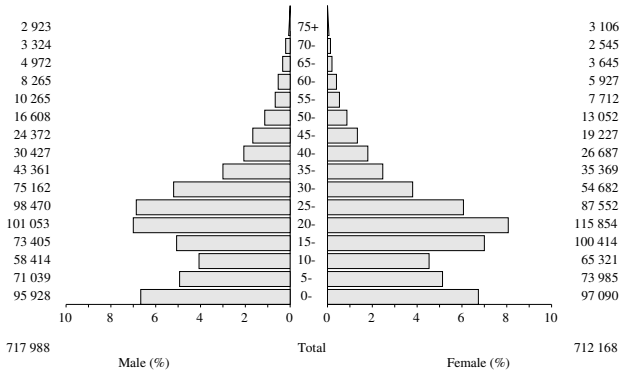
Zimbabwe, Harare: African

REGISTRATION AREA
The Zimbabwe National Cancer Registry was established in Harare in 1985 as a result of an agreement between IARC and the Zimbabwean Ministry of Health. The registry became population-based in 1990 and covers the population of the city of Harare (1.4 million inhabitants).

CANCER CARE FACILITIES
There are two large central referral hospitals: Harare Central Hospital and Parirenyatwa Hospital.



REGISTRY STRUCTURE AND METHODS
The registry is strategically located at Parirenyatwa Hospital, a large government referral centre and the location of the University of Zimbabwe's College of Health Sciences. It is supported by the Zimbabwean Ministry of Health and Child Welfare, IARC, and other organizations. The activities of the registry are overseen by a constituted advisory committee, and the day-to-day administration is the responsibility of the registrar under the guidance of the medical director. The registry has four full-time staff members: a registrar, a secretary, and two data collection clerks. Case finding is mainly active, carried out through visits to health care delivery institutions involved in the management of cancer patients. Data sources include routine visits to the inpatient wards of the two government central referral hospitals, medical records of discharged and deceased cancer patients, visits to oncology outpatient clinics, histology reports from the public and private sectors, medical records from the radiotherapy department, and death certificates of patients who died of cancer in greater Harare. The information recorded for each case includes sex, date of birth or age, residence status, racial group, basis of diagnosis, tumour site, and histology. When possible, demographic data and residence status are verified through hospital inpatient interviews. Incoming notifications are thoroughly verified to ensure the recording of incident cases only. Data are coded according to the ICD-O system and stored electronically using CanReg software.

INTERPRETING THE RESULTS
Residence status is defined as the patient's place of residence during the previous 6 months.

USE OF THE DATA
Data from the registry are extensively used by Zimbabwean and foreign researchers, lecturers, students, conference participants, and health educators, as well as by the Zimbabwean Ministry of Health and Child Welfare for management planning and cancer control programmes.

Argentina, Bahía Blanca

REGISTRATION AREA

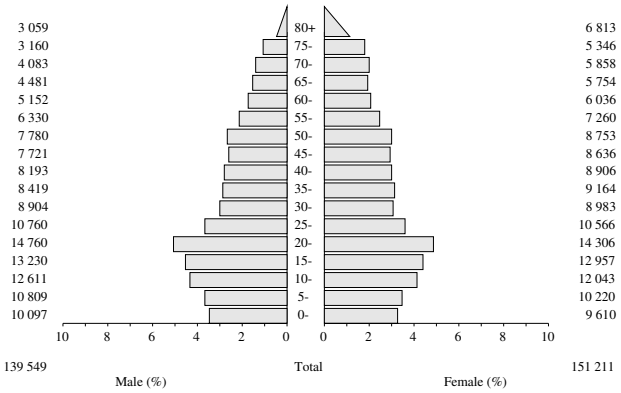
The Regional Tumor Registry of the South of the Province of Buenos Aires covers the political area of Bahía Blanca, with a population of 290 000 at the 2005 census. Nearly 100% of the population is White, primarily descended from European immigrants. In some political areas, such as Coronel Suárez, there are settlements of German descendants. In the south of the province, a varying population of workers comes from Chile for the onion harvest, but the permanent Chilean population amounts to less than 5% of the total population.

CANCER CARE FACILITIES

Both of the area's public hospitals provide oncology services. There are two private radiotherapy institutes, which also treat patients from public hospitals; one has a linear accelerator. Computerized tomography is available in almost all the larger public and private institutions, and one institution has a nuclear magnetic resonance imaging facility.

REGISTRY STRUCTURE AND METHODS

Although the registry was recognized by a provincial law and a municipal resolution in 1993, it does not have a specific budget. The Argentine Association for Cancer Prevention and Education (AAPEC), a non-profit organization founded in 1986 to improve cancer control, maintains the registry and other high-priority projects, such as the tobacco control programme. Although resources are limited, the registry employs two registrars and a registry coordinator. Most of the registry's resources are provided by the municipal government of Bahía Blanca.



USE OF THE DATA

Incidence reporting is the most important activity of the registry, as population-based cancer registration is limited in the country. The registry is currently involved in epidemiological research, and policy-makers use its data for planning and evaluating health services. In 2011, an agreement was reached between the municipality of Bahía Blanca, the Health Sciences Department of the National University of the South, and AAPEC to improve cancer registration quality and increase data use. The agreement includes the creation of two scholarships for advanced medical students. The registry has recently performed studies on cancer incidence trends and was invited to participate in the CONCORD-2 survival study.

§Includes 114 cases of unknown age

§Includes 144 cases of unknown age

Argentina, Córdoba

REGISTRATION AREA

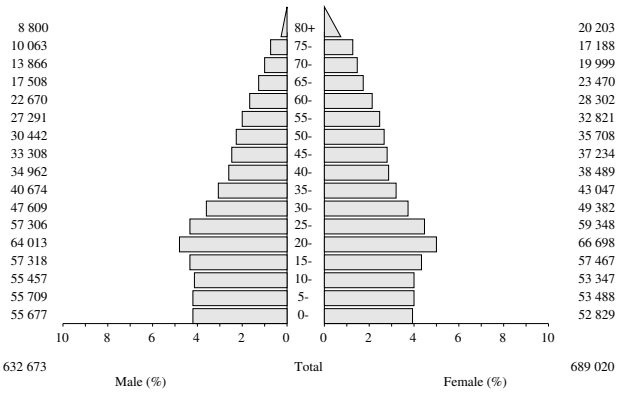
The Córdoba Cancer Registry covers the city of Córdoba (the capital of Córdoba Province), with an area of 576 km^2. The population is approximately 1.3 million (48% male).

CANCER CARE FACILITIES

The health system in Córdoba Province consists of private and public providers. There are 12 public hospitals, each with pathology and oncology services. There are also 20 private health care institutions that provide care for cancer patients. Data are collected from 17 of these; in the others, the number of cancer patients is very low. There are two radiotherapy centres and two highly complex diagnostic centres in the city.

REGISTRY STRUCTURE AND METHODS

The registry is located at the Provincial Cancer Hospital, with a dedicated office and all equipment necessary to carry out its activities. The staff consists of two medical doctors, a statistician, and two registrars. Data are collected both actively and passively from all 33 of the above-mentioned sources. In addition, the social insurance of state employees (25% of the population) provides pathology results. Information on death certificates is obtained from the State Statistics Department. Data are recorded using CanReg4 software. Quality checks are done periodically using IARC tools to calculate the standard quality indicators.



USE OF THE DATA

The registry has produced three publications, and is participating in the most recent CONCORD survival study. Registry data have been provided to university instructors and researchers for a variety of projects. The registry has also been consulted by state judicial courts to provide information on environmental issues in the city.

§Includes 5 cases of unknown age

Argentina, Mendoza

REGISTRATION AREA

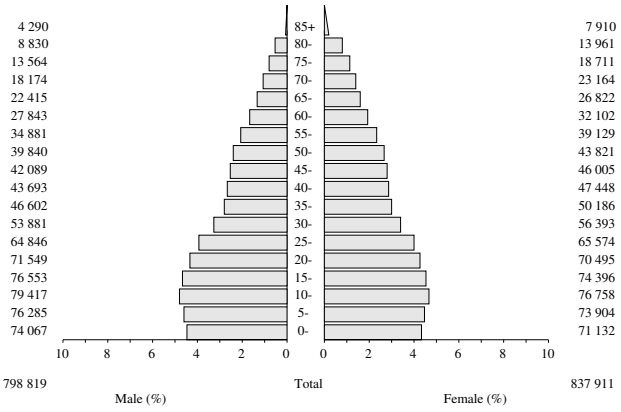
The Mendoza Cancer Registry covers Mendoza Province, with an area of 148 827 km^2. The Andes mountain range is located to the west, and most of the rest of the province consists of desert plains. The population of 1.6 million is distributed across 18 municipalities, with 79% of residents living in urban areas. The population is ethnically heterogeneous, with a mixture of Native peoples and Europeans. Chilean, Bolivian, and Peruvian immigration to the area has increased in recent decades. The economically active population works in agriculture, livestock, business, mining, services, and industry.

CANCER CARE FACILITIES

Cancer diagnosis and treatment are provided through the public, private, and social security systems. Oncology services are provided by six state hospitals, two social security hospitals, and five private hospitals. Three centres provide radiation therapy. The 49.1% of the population that is not covered by social security can receive treatment through the Mendoza Oncology Program. There is also a cervical and breast cancer prevention and early detection programme.

REGISTRY STRUCTURE AND METHODS

The registry was created by law, and its administration and budget are handled by the Epidemiology Division of the Mendoza Health Department. The registry is staffed by three medical doctors and three registrars, who are in charge of passive and active data collection from private and public hospitals, pathology and haematology laboratories, radiation therapy centres, and private practices. The registry also has access to death certificates. Data are collected manually from medical records, anatomical pathology reports, and computerized lists provided by the various sources. Data are coded at the Registry Central Unit using ICD-O-3. Data entry is performed using CanReg software.



USE OF THE DATA

The registry started data collection in 2003, and the first analysis was carried out in 2010. The resulting information was provided to local authorities and professionals and to the National Cancer Institute.

SOURCE OF POPULATION

Based on the 2001 census carried out by the Argentine National Institute of Statistics and Censuses (INDEC; http://www.indec.gov.ar). INDEC also calculated annual estimates for the province of Mendoza, making allowances for births and deaths. It was not possible to estimate migration effects.

Argentina, Tierra del Fuego

REGISTRATION AREA

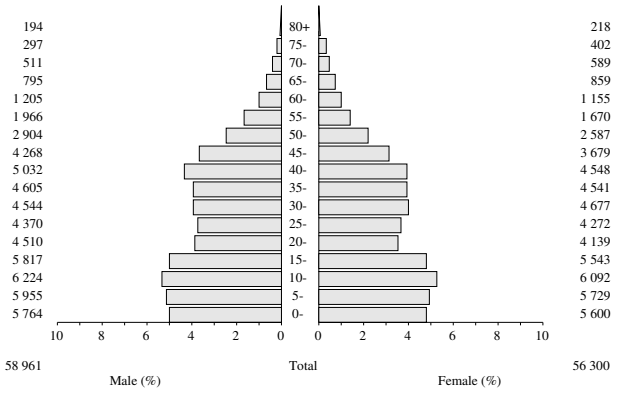
The Cancer Registry of Tierra del Fuego Province covers the entire population of Tierra del Fuego Province, which has an area of 21 571 km^2. The climate is cold, with the median temperature ranging between 3 °C and 12 °C. At the 2001 census, the population was 100 000, with a density of 4.7 inhabitants/ km^2 and 97% of residents living in urban areas. The province's main cities are Ushuaia (the capital) and Río Grande. The majority of the population is White; 56% of residents are immigrants from other Argentine provinces and 11% are foreigners. Almost all of the population is of the Catholic religion.

CANCER CARE FACILITIES

Diagnosis and treatment are mainly provided by two public hospitals, which are complemented by two private clinics. The services available include clinical oncology, haematology-oncology, tomography, mammography, magnetic resonance imaging, chemotherapy, and surgery. Radiotherapy services are not available. The proportion of the population not covered by social security is 30.1%. These individuals are typically covered by a social support system administered by the provincial government.

REGISTRY STRUCTURE AND METHODS

The registry was created by law (Ley Provincial No. 557/02), and its implementation began in 2003. It is a separate unit located in the Epidemiology Department of the Ministry of Health. Data collection is both passive and active, and 73% of cancer cases were reported by public health institutions. CanReg software is used for data entry and analysis. The staff consists of an oncologist, an epidemiologist, an administrator, and a full-time dedicated nurse who serves as the director of the registry.



USE OF THE DATA

The information is used by a variety of health professionals, including health decision-makers and students, and is also used as a basis for research. Cancer incidence data for the period from 2003 to 2007 were published in 2008 and can be found on the Ministry of Health's website.

Brazil, Aracaju

REGISTRATION AREA

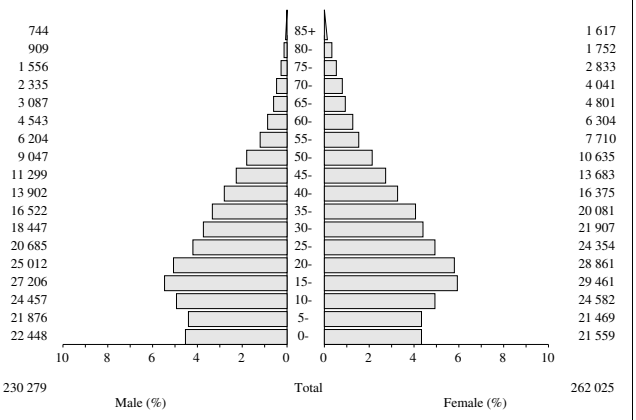
The Cancer Registry of Aracaju covers the urban area of the city of Aracaju, in the north-eastern region of Brazil. Aracaju has an area of 181 856 km^2 and a population of 499 000. The annual growth rate is 2.0%. The city of Aracaju is 4 m above sea level. Its climate is warm and humid, with an average annual temperature of 26.0 °C.

CANCER CARE FACILITIES

The city of Aracaju has a network of 29 public and private hospitals, with a total of 2229 beds (4.47 per 1000 inhabitants). Aracaju has two universities and two medical schools. Other cancer diagnostic and treatment facilities include two radiation therapy clinics, seven chemotherapy clinics, several ultrasound and radiology clinics, and six clinical pathology laboratories.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1998 and is located in the state of Sergipe. It has permanent funding. The staff includes a medical coordinator and four registrars. The advisory committee includes a pathologist and three oncologists. Data are actively collected from sources that include a university hospital, two general hospitals, six anatomical pathology laboratories, an oncology clinic, two chemotherapy clinics, and four general health systems (APAC, Siscolo, Sismama, and SIM). Information about deaths is retrieved from the Mortality Information System of the Ministry of Health.



USE OF THE DATA

The data are used for a variety of purposes, including to estimate incidence and geographical distribution of cancer cases, to study temporal trends, for survival assessments, to evaluate screening programmes, to carry out geographical referral of cancer cases through a spatial assessment of cancer cases in Aracaju, for epidemiological studies, and for teaching purposes.

§Includes 8 cases of unknown age

Brazil, Belo Horizonte

REGISTRATION AREA

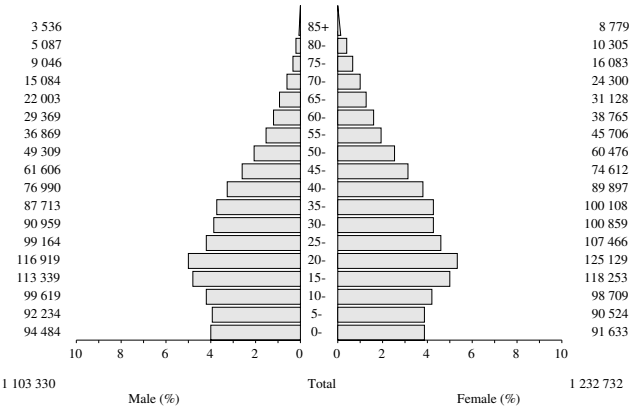
The Population-based Cancer Registry of Belo Horizonte covers the city of Belo Horizonte, in the south-eastern region of Brazil. Belo Horizonte has an area of 331 400 km^2 and a population of 2.4 million (all living in urban areas). Between the 2000 and 2010 censuses, the annual growth rate was 0.6%. The city of Belo Horizonte is 852 m above sea level. Its climate is tropical, with warm summers and an average annual temperature of 21.1 °C.

CANCER CARE FACILITIES

The city of Belo Horizonte has a network of 75 modern public and private hospitals, with a total of 9983 beds (4.07 per 1000 inhabitants). Other cancer diagnostic and treatment facilities include 23 radiation or chemotherapy services, 37 haematological services, and 121 cytopathology or pathology services. Belo Horizonte has 85 universities, five of which offer degrees in medicine.

REGISTRY STRUCTURE AND METHODS

The registry was created in 2001. It is located in the Health Surveillance Secretariat of the State Secretariat of Health of Minas Gerais, within the Program for Evaluation and Monitoring of Cancer and its Risk Factors of Minas Gerais. The registry has permanent funding, and data are collected actively. The registry staff includes an epidemiologist coordinator, two statisticians, a field supervising nurse, nine collection registrars, a coding registrar, and a field supervisor of the hospital-based cancer registries. The advisory committee includes an epidemiologist, two statisticians, and an oncologist. Data are actively collected from 43 sources, which include a specialized hospital, a university hospital, 16 general hospitals, and 23 pathology laboratories. Information about deaths is retrieved from the Mortality Information System of the Ministry of Health.



USE OF THE DATA

The data are used for a variety of purposes, including to estimate incidence and geographical distribution of cancer cases, to study temporal trends, for survival assessments, to evaluate screening programmes, to carry out geographical referral of cancer cases through a spatial assessment of cancer cases, for epidemiological studies, and for teaching purposes.

Brazil, Cuiabá

REGISTRATION AREA

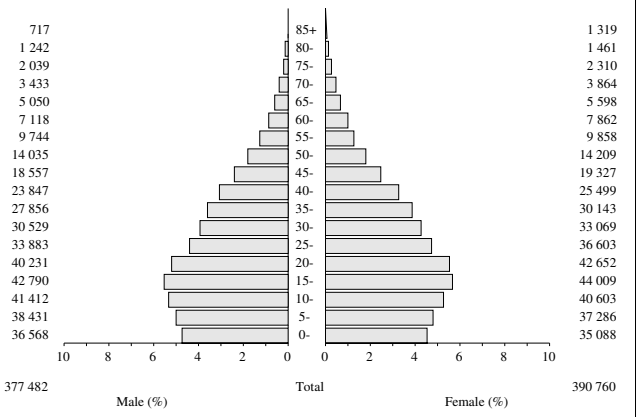
The Population-based Cancer Registry of Cuiabá covers the cities of Cuiabá and Várzea Grande, in the mid-west region of Brazil. Cuiabá and Várzea Grande have a total area of 4482 km^2 and a combined population of 783 000 (98% living in urban areas). The annual growth rate is 2%. Cuiabá and Várzea Grande are 177 m and 191 m above sea level, respectively. The area's climate is continental tropical, with warm summers and an average annual temperature of 33 °C.

CANCER CARE FACILITIES

The area has a health care network of four public and five private hospitals, with 1477 public beds (1.87 per 1000 inhabitants). There are seven universities and two medical schools. Other cancer diagnostic and treatment facilities include three radiation therapy clinics, seven chemotherapy clinics, 15 ultrasound clinics, 10 clinical pathology laboratories, and 18 radiology clinics.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1999. It is located in the State Health Secretariat of Mato Grosso and has permanent funding. The registry has a coordinator and two registrars. The advisory committee includes an epidemiologist, a statistician, a pathologist, and an oncologist. Data are actively collected from sources including a specialized hospital, two university hospitals, a general hospital, 10 anatomical pathology laboratories, a haematology clinic, two oncology clinics, three radiation therapy clinics, and seven chemotherapy clinics. Information about deaths is retrieved from the Mortality Information System of the Ministry of Health.



USE OF THE DATA

The data are used to determine cancer incidence and geographical distribution of cancer in the area, to study temporal trends, for survival studies, to evaluate screening programmes, for teaching purposes, and for various epidemiological studies. The information has also been published in scientific papers.

CONTRIBUTORS

Maria Jose Lemes de Oliveira

REGISTRATION AREA

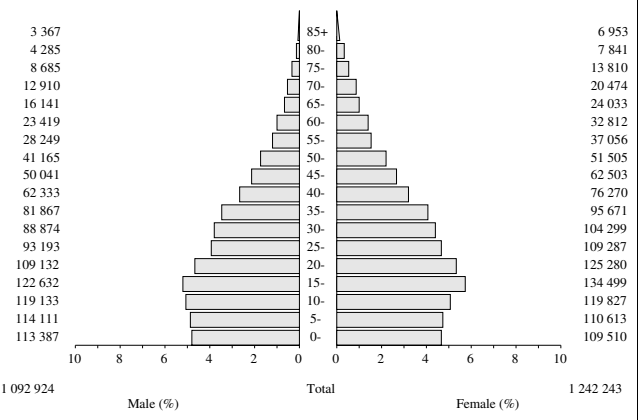
The Population-based Cancer Registry (PBCR) of Fortaleza covers the city of Fortaleza, in the north-eastern region of Brazil. Fortaleza has an area of 313 km^2 and a population of 2.5 million (100% living in urban areas). The annual growth rate is 2.6%. Fortaleza is at sea level and its climate is equatorial, with an average annual temperature of 27 °C.

CANCER CARE FACILITIES

The city of Fortaleza has a network of 60 public and private hospitals, with a total of 7177 beds (3.13 per 1000 inhabitants). Fortaleza has three universities and four medical schools. Other cancer diagnostic and treatment facilities include two radiation therapy clinics and eight chemotherapy clinics.

REGISTRY STRUCTURE AND METHODS

The PBCR of Fortaleza was established in 1973 and is located in the State Health Secretariat. The registry has permanent funding, and data are collected actively. The registry staff includes a medical coordinator and four registrars. Data are collected from 44 sources: a specialized hospital, a university hospital, 22 general hospitals, eight anatomical pathology laboratories, two haematology clinics, two radiation therapy clinics, and eight chemotherapy clinics. Information about deaths is retrieved from the Mortality Information System of the Ministry of Health.



USE OF THE DATA

The data are used for a variety of purposes, including to estimate incidence and geographical distribution of cancer cases, to study temporal trends, for survival assessments, for epidemiological studies, and for teaching purposes.

§Includes 23 cases of unknown age

§Includes 49 cases of unknown age

Brazil, Goiânia

REGISTRATION AREA

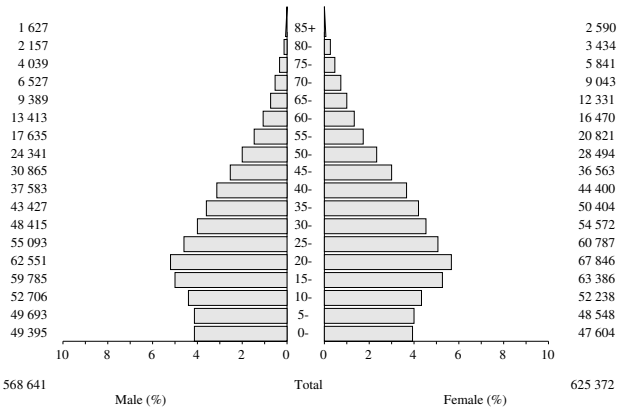
The Population-based Cancer Registry of Goiânia is located in the central part of Brazil. The area's climate is tropical, and the city is hot and sunny almost all year long, with an average annual temperature of 23–33 °C. Goiânia, the second planned city in Brazil, is now 78 years old. The majority of the population lives in rural areas, and the main religion is Catholicism.

CANCER CARE FACILITIES

There is one cancer centre (with 180 beds), which is also a training facility for oncological surgery, radiotherapy, and chemotherapy. There are two radiotherapy units, six linear accelerators, a brachytherapy unit, 14 chemotherapy units, 10 oncology clinics, 33 pathology laboratories, and two bone marrow centres. There are also two medical schools and eight nursing schools.

REGISTRY STRUCTURE AND METHODS

The registry is located in a private cancer hospital centre and is coordinated by an oncologist. It also employs a supervisor; an epidemiologist; and four registrars responsible for data collection, coding, and data entry. There is also an advisory council, which consists of a pathologist and an oncologist. Data collection is active. The registry has access to death certificates, which include information on identification. The registry uses the IARC/IACR rules (2004) for multiple primary tumours. Quality control procedures include verification of date of birth versus topography, sex versus topography and morphology, duplication, and mortality versus incidence. The registry area has screening programmes for breast, cervical, skin, and prostate cancer.



USE OF THE DATA

Incidence data are reported to the data sources periodically. The registry carries out many epidemiological studies, including studies that investigate survival associated with several cancer sites. The registry also produces many publications and has participated in international collaborative projects such as CONCORD, INHANCE, and (more recently) InterCHANGE. Collaborative research is also being carried out on cancers of the oral cavity, larynx, and oesophagus. Data are provided to the National Cancer Institute of Brazil (INCA) to estimate cancer incidence at the national and subnational levels.

Brazil, São Paulo

REGISTRATION AREA

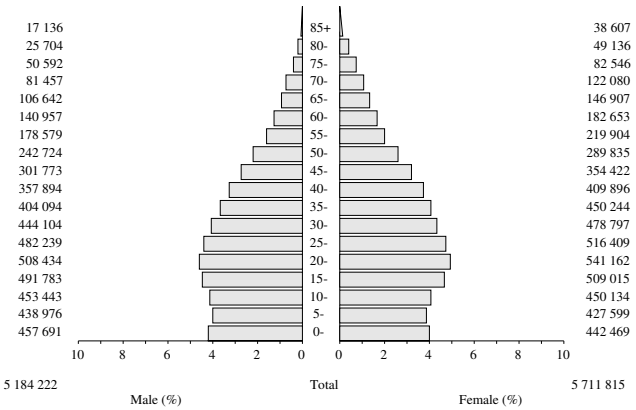
The Population-based Cancer Registry of São Paulo covers the city of São Paulo, in the south-eastern region of Brazil. São Paulo has an area of 1 522 986 km^2 and a population of 11.2 million (with 99% living in urban areas). The annual growth rate is 0.66%. São Paulo is 792 m above sea level. Its climate is subtropical, with warm summers and an average annual temperature of 18.3 °C.

CANCER CARE FACILITIES

The city of São Paulo has a network of 212 public and private hospitals, with a total of 29 483 beds (2.6 per 1000 inhabitants). There are 196 universities and eight medical schools. Other cancer diagnostic and treatment facilities include 15 radiation therapy and chemotherapy clinics, 751 ultrasound clinics, and 157 clinical pathology laboratories.

REGISTRY STRUCTURE AND METHODS

The registry was established in 1969 and is located in the Public Health School of the University of São Paulo. The registry has permanent funding, and data are collected actively. The registry employs a general coordinator, a database coordinator, five typists, a source-of-information coordinator, six registrars, and a systems analyst. It also has an advisory committee, which includes three epidemiologists, three statisticians, a pathologist, and an oncologist. Data are collected from 301 sources: 168 hospitals, 35 anatomical pathology laboratories, 76 oncology clinics, two death investigation services, and 20 hospital-based cancer registries. Information about deaths is retrieved from the Program for Improvement of Death Information (PRO-AIM).



USE OF THE DATA

The registry data are used for many purposes, including to estimate incidence and geographical distribution of cancer cases, to study temporal trends, for survival assessments, to evaluate access to screening programmes, for geographical referral of cancer cases through a spatial assessment of cancer cases in the city, for epidemiological studies, for scientific articles, and for teaching purposes.

Chile, Region of Antofagasta

REGISTRATION AREA

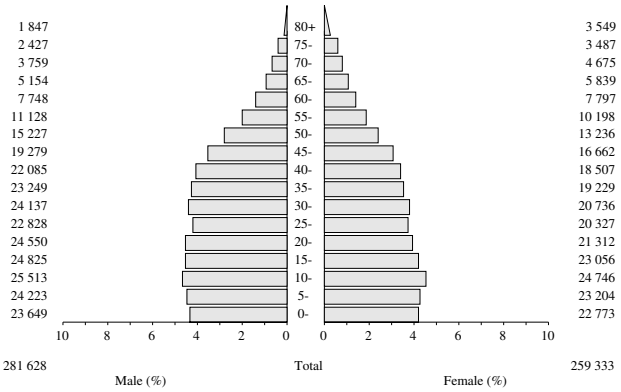
The Regional Cancer Registry II, Region of Antofagasta covers the Antofagasta Region of northern Chile, with an area of 126 049 km^2. At the 2007 census, the region's population was 555 000, living mainly in urban areas (97.6%). The population consists mainly of members of the Atacama and Aymara ethnic groups. The Antofagasta Region is a desert area, with high levels of ultraviolet radiation. Its main economic activity is mining. There are large deposits of copper, and environmental issues are important. The soil contains significant deposits of arsenic, to which the population has been exposed through the drinking-water (particularly from the 1950s to the late 1970s).

CANCER CARE FACILITIES

For diagnosis, five public and five private hospitals are available. Treatment is available at two public hospitals; one provides surgery and the other provides medical oncology and radiotherapy. The latter hospital also serves as a referral centre for the region. Some cancers, such as those of the breast and stomach, are given high priority by national plans and programmes.

REGISTRY STRUCTURE AND METHODS

The population-based cancer registries of Chile were created by law in 2002, and data confidentiality is protected by two laws (Ley 19.628 and Ley 20.285). The registry is funded by the Ministry of Health and is located in the Regional Health Secretariat of the Antofagasta Region. The staff consists of two professionals, and the registry uses both active and passive data collection. The database is managed using CanReg5 software, and IARC tools are used for quality control. Technical assistance is provided at the national level, and more recently, also by the Tarragona Cancer Registry in Spain.



USE OF THE DATA

The registry has published a report presenting data for the period from 2003 to 2007. Registry staff members also participate in meetings to help develop cancer control strategies in the region.

Chile, Bío Bío Province

REGISTRATION AREA

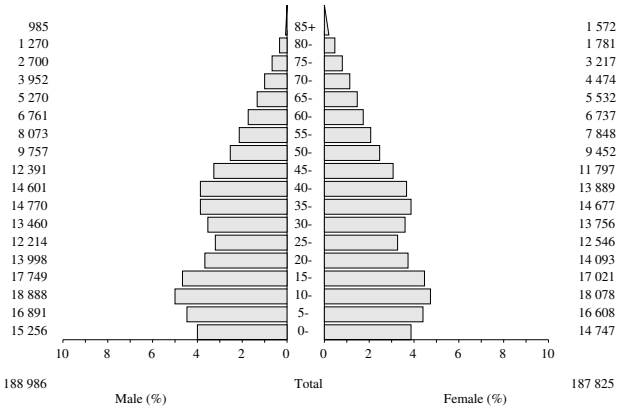
The Population-based Cancer Registry of Bío Bío, Chile, covers the 14 municipalities of Bío Bío Province, located in the Bío Bío Region of south-central Chile. At the 2005 census, the province's population was 380 000. Of the total population, 51% of residents were female, 8.4% were older than 64 years, 31% lived in rural areas, and 7% were members of the Mapuche ethnic group.

CANCER CARE FACILITIES

The majority of the medical services available are provided by the public health care system, to which 80% of patients have access. The public system includes seven hospitals (one of which is of higher complexity). There are also three private hospitals in the province. The public hospitals provide university teaching. Patients requiring radiotherapy, and some requiring surgical treatment, are referred to the regional reference hospital and other hospitals in the region. All cases of childhood cancer are referred to the reference hospital. The main provincial hospital provides pathology, haematology, oncologic surgery, chemotherapy, and palliative care services.

REGISTRY STRUCTURE AND METHODS

The population-based cancer registries of Chile were created by law in 2002, and data confidentiality is protected by two laws (Ley 19.628 and Ley 20.285). The registry is part of the epidemiology unit of the provincial office of the Regional Health Authority. It has its own office and computer equipment, and the staff consists of a medical epidemiologist and a nurse (both working at the registry part-time), with support from administrative personnel. Data collection is both active and passive. The registry receives reports from various sources, as well as notifications from national cancer and childhood cancer programmes. The registry also collects data from official mortality statistics. Clinical reports and death certificates are actively reviewed. CanReg4 software is used for data storage and quality control. Coding is done by the registry's staff. Standard indicators are used for quality control. There are two national cancer screening programmes: for cancers of the cervix uteri and breast in women. These programmes include physical examinations and mammograms in high-risk groups. Changes in environmental exposures are not registered.



USE OF THE DATA

The registry has published a report presenting data for the period from 2003 to 2007.

CONTRIBUTORS

Ana María Moraga Palacios
María Elena Umaña Cid

Chile, Bío Bío Province (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on data published by the National Statistics Institute of Chile (INE) in its April 2002 report *Population Estimates and Projections of the XVII National Population Census (1990–2020)*.

Chile, Valdivia

REGISTRATION AREA

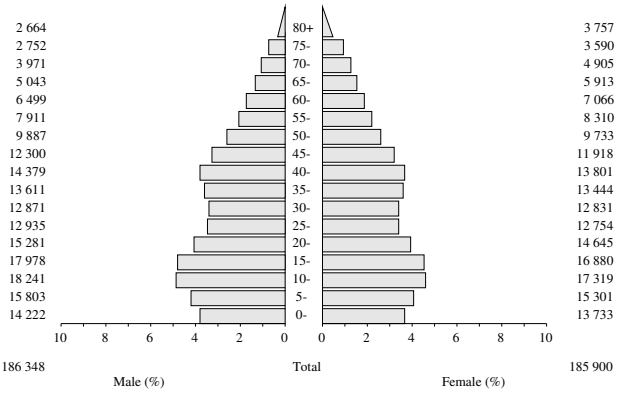
The Valdivia Cancer Registry covers the Los Ríos Region of Chile. At the 2005 census, the region's population was 372 000, with a male-to-female ratio of 1:1. The majority of the population lives in urban areas, with 32% living in rural areas. Members of minority ethnic groups account for 11.4% of the population, and 68% of residents are of the Catholic religion.

CANCER CARE FACILITIES

The public health care network (which covers 83.6% of the region's population) includes 17 primary health care centres, eight health care centres that provide only certain services, and the only oncological hospital in the region (Hospital Clínico Regional de Valdivia), which provides oncological surgery, radiotherapy, and chemotherapy, as well as diagnostic services, imaging, cytology, and pathology. It is also a teaching centre. In the private sector, surgery and chemotherapy, as well as anatomical pathology services, are available for adult patients. The public university hospital is the only treatment provider for childhood cancers.

REGISTRY STRUCTURE AND METHODS

The registry follows strict confidentiality rules in accordance with Chilean laws protecting private information (Ley 19.628 and Ley 18.575). The registry employs only one public health professional, and it receives technical assistance from the hospital-based cancer registry. The registry uses both active and passive data collection and uses standard quality indicators (percentage of cases with microscopic verification, percentage of death-certificate-only cases, and mortality-to-incidence ratio). Although it is not possible for the registry to collect information on the cases that finish treatment in other regions, this figure might be relatively insignificant since the regional oncological hospital in Valdivia is the only one in the area.



USE OF THE DATA

Incidence and mortality information is disseminated regularly and is available from http://www.seremisaludlosrios.cl/. A wide variety of studies, including survival studies, are also carried out based on the registry data.

Colombia, Bucaramanga

REGISTRATION AREA

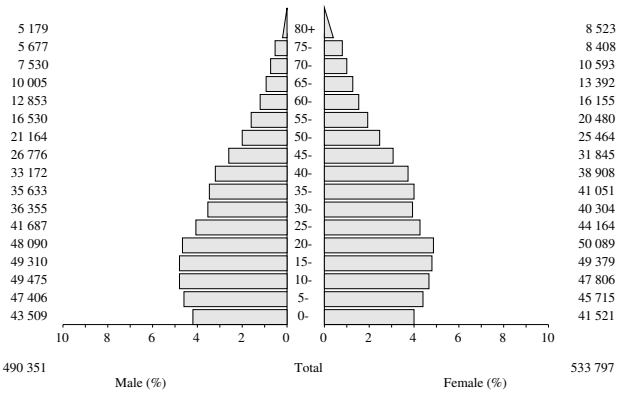
The Population-based Cancer Registry of the Bucaramanga Metropolitan Area (RPC-AMB) covers the populations of four municipalities (Bucaramanga, Floridablanca, Girón, and Piedecuesta) in the Andean region of Colombia, over an area of 1479 km^2. At the mid-year 2005 census, the population covered by the registry was 1 million, with 94% living in urban areas. The majority of the area's residents are Mestizo (of mixed Spanish and Amerindian ancestry).

CANCER CARE FACILITIES

Most Colombians are covered by the national health system, through two social security regimes: a contributive regime for workers and their families (who can afford to pay) and a subsidized regime for the poor. Both regimes are affiliated with health maintenance organizations (HMOs), which administer the provision of health services through contracts with health care institutions and providers. Oncological care is provided mainly by private institutions. Only one of the five general public hospitals in the registry area provides oncology services. Cancer diagnostic and treatment facilities include 10 clinics, two radiation therapy centres, four chemotherapy units, 11 pathology laboratories, two oncologists, and several clinical specialists in oncology.

REGISTRY STRUCTURE AND METHODS

The RPC-AMB was established in 2000, and data collection began the same year. The registry is located within the Medicine Program of the Autonomous University of Bucaramanga. Financial support is provided by the university (as a research project) and by the National Cancer Institute in Bogotá. The registry staff includes a director, a coordinator, a digitizer, and three registrars. Data collection is active. Information from death certificates is obtained from the local office of vital statistics. The registry uses the IARC/IACR rules (2004) for multiple primary tumours, as well as CanReg4 software.



USE OF THE DATA

Several quality control studies and epidemiological studies of selected cancer sites have been carried out, and the results have been published locally. The data have also been used by graduate students for their master's degree dissertations. The registry prepares a periodic report on cancer incidence.

§Includes 20 cases of unknown age

§Includes 23 cases of unknown age

Colombia, Cali

REGISTRATION AREA

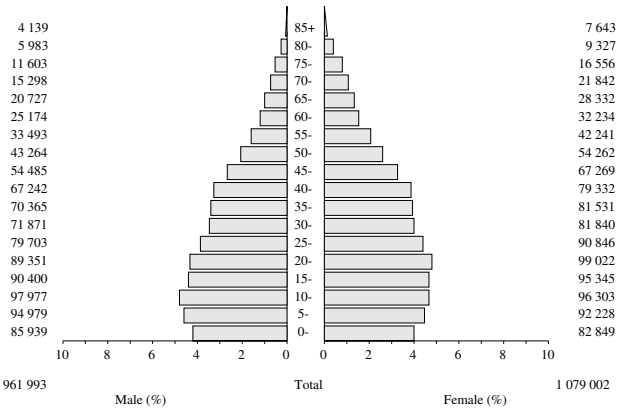
The Cali Cancer Registry (CCR) covers the urban area of Cali, the third-most populous city in Colombia. The total registration area is 120.9 km^2. At the most recent official census (2005), the population was 2 million. The large majority of the population is Mestizo (of mixed Spanish and Amerindian ancestry), with a minority of Blacks and Whites. More than half of the population of Cali consists of migrants from other areas of Colombia.

CANCER CARE FACILITIES

Most Colombians are covered by the national health system, through two social security regimes: a contributive regime for workers and their families (who can afford to pay) and a subsidized regime for the poor. Both regimes are affiliated with health maintenance organizations (HMOs), which administer the provision of health services through contracts with health care institutions and providers. Cancer care services in Cali, including screening, diagnosis, and treatment, are provided through this system, but cancer treatment is provided mainly by private institutions.

REGISTRY STRUCTURE AND METHODS

The CCR has been in continuous operation since 1962, within the Department of Pathology of the Universidad del Valle. Its staff includes a director (the university's professor of pathology), three assessing pathologists, an epidemiologist coordinator, three records clerks, and a data manager. Cancer notification is not compulsory in Colombia. The CCR uses active case finding from various data sources consisting of cancer hospitals, general hospitals, teaching hospitals, and pathology laboratories. Every 2 years, a group of 25 specially trained medical students is selected to carry out a field survey of the files of all private physicians who diagnose or treat cancer patients. Information from death certificates is obtained from the Municipal Office of Vital Statistics. The death registration system is adequate and complete. No active follow-up is carried out.



USE OF THE DATA

The CCR studies incidence and mortality trends using the age–period–cohort model. Long-term survival analysis has been carried out for the five leading causes of cancer and for all cases of childhood cancer. The CCR publishes cancer statistics on its website (http://rpcc.univalle.edu.co).

Colombia, Manizales

REGISTRATION AREA

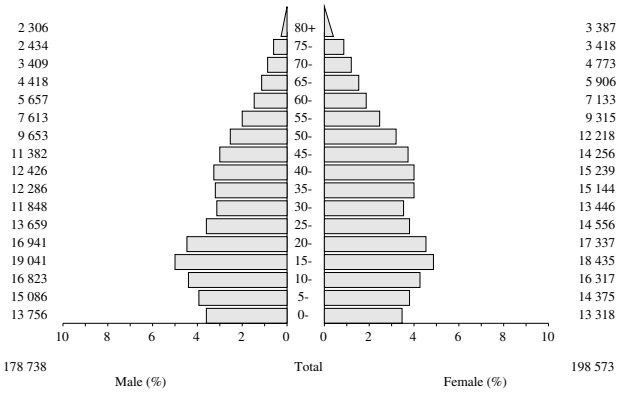
The Population-based Cancer Registry of Manizales covers the urban and rural population of the city of Manizales, which is located 2150 m above sea level in the Andean region of Colombia. The average temperature is 18 °C. At the most recent census (2005), the population was 368 000. About 80% of residents live in urban areas, and 85% are Catholic. The area's economy is based on agriculture, marketing, and coffee exportation.

CANCER CARE FACILITIES

Most Colombians are covered by the national health system, through two social security regimes: a contributive regime for workers and their families (who can afford to pay) and a subsidized regime for the poor. Both regimes are affiliated with health maintenance organizations (HMOs), which administer the provision of health services through contracts with health care institutions and providers. Most cancer care institutions in Manizales belong to the private network of providers – including imaging, cytology, and pathology services, as well as radiotherapy, chemotherapy, and cancer surgery services.

REGISTRY STRUCTURE AND METHODS

The registry is supported by the University of Caldas and the National Cancer Institute (INC). The registry staff consists of a part-time medical officer, a full-time registrar, and three part-time health workers. The registry uses active case finding from 38 data sources consisting of hospitals, clinics, cancer care institutions, cytology and pathology laboratories, imaging services, HMOs, and the district's vital statistics office. Although cancer is not a reportable disease in Colombia, registration forms are received from some private practitioners.



USE OF THE DATA

The registry prepares an annual report on cancer incidence, and recently initiated several cancer survival studies.

Colombia, Pasto

REGISTRATION AREA

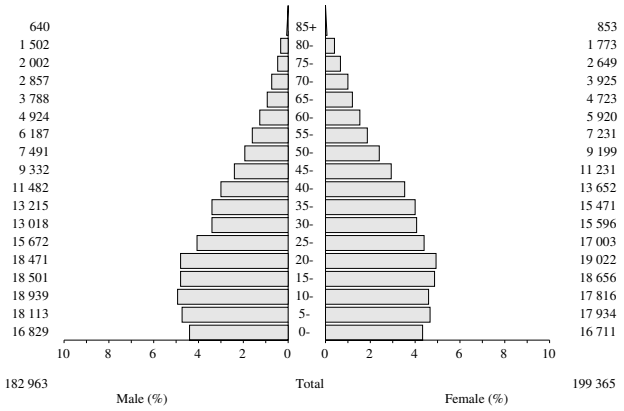
The Cancer Registry of Pasto covers the population of Pasto (the capital city of the department of Nariño), located in the southern Andean region of Colombia. At the 2005 census, the population was 383 000, with 82% living in urban areas. The majority of residents are Mestizo (of mixed Spanish and Amerindian ancestry), and most of the population is of the Roman Catholic religion.

CANCER CARE FACILITIES

Most Colombians are covered by the national health system, through two social security regimes: a contributive regime for workers and their families (who can afford to pay) and a subsidized regime for the poor. Both regimes are affiliated with health maintenance organizations (HMOs), which administer the provision of health services through contracts with health care institutions and providers. The major cancer facilities in Pasto are six cytology and pathology laboratories, three hospitals with radiotherapy and chemotherapy services, and five oncology units.

REGISTRY STRUCTURE AND METHODS

The registry was created in 1998 (conceived as a permanent research project) at the University of Nariño's Center for Health Studies, in collaboration with the Municipal Health Secretariat. The registry is endorsed by the university's ethics committee and receives resources from the university. It is cosponsored by the Instituto Nacional de Cancerología (INC) in Bogotá. It also receives technical advice from the Cali Cancer Registry. The registry staff includes a director, a pathologist, a statistician, an assistant director, a computer engineer, a quality control technician, a coordinator, and two registrars. Information is actively collected from 39 sources consisting of hospitals, oncology units, pathology laboratories, specialized clinics, and the Municipal Health Secretariat, which is responsible for mortality information. Rare cases are addressed by the scientific committee, composed of specialists. Recently, through INC, the registration's completeness and validity have been significantly improved.



USE OF THE DATA

The purpose of the registry is to provide cancer incidence data for decision-making and for the implementation of promotion and prevention activities. To date, the registry has published cancer incidence rates for the period from 1998 to 2002. The registry has also supported epidemiological studies on cervical, colorectal, and gastric cancers, as well as childhood cancers.

Costa Rica

REGISTRATION AREA

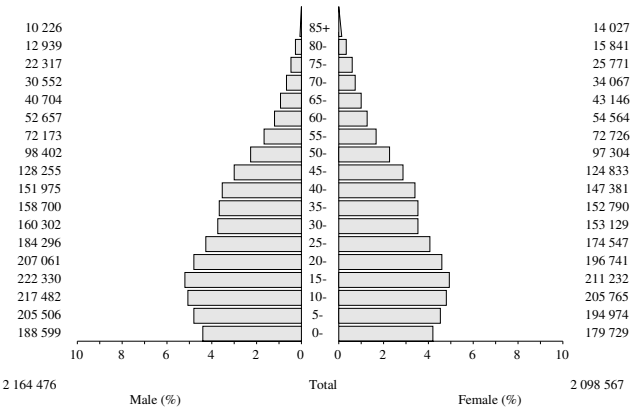
The Costa Rica National Tumor Registry covers the entire country, which has an area of 51 100 km^2. At the 2000 census, the population was 3.8 million (1.9 million males and 1.9 million females), with 59% living in urban areas. The main ethnic group is Caucasian–Natives, and there are smaller proportions of Blacks, Natives, Chinese, and Caucasian–Blacks.

CANCER CARE FACILITIES

The national social security system covers more than 90% of the population and is organized in three levels. Patients suspected to have cancer are referred to the second and third (specialized) levels. The social security system includes 29 hospitals, five of which have an oncology department. There are four radiotherapy departments in Costa Rica – two public and two private.

REGISTRY STRUCTURE AND METHODS

The registry was founded in December 1976 by executive order, and nationwide coverage was achieved in 1980. Its objectives are to collect data on cancer incidence and mortality by age, sex, tumour site, and geographical distribution. The registry is part of the Unit of Monitoring Health Indicators within the Bureau of Health Surveillance at the Ministry of Health, which provides financial support. The registry has three full-time technicians, who are supported by medical staff members, epidemiologists, and public health specialists. There is also an evaluation team, which conducts visits to hospitals and private clinics to check the quality of information. The registry's data sources consist of biopsy reports with a diagnosis of cancer from all pathology services, death certificates, hospital discharge information, and mortality databases from the National Statistics Department. The registry is fully computerized and uses databases from the National Civil Registry to complete information. The level of underreporting is low, due to the characteristics of the health system and the vital statistics system.



USE OF THE DATA

Costa Rica has made significant efforts to establish early detection programmes for cancer, particularly for breast, cervical, stomach, colon, prostate, and skin cancers. The registry information is used in cancer control decision-making at several levels, and is also used for research and teaching purposes.

§Includes 100 cases of unknown age

§Includes 81 cases of unknown age

Cuba, Villa Clara

REGISTRATION AREA

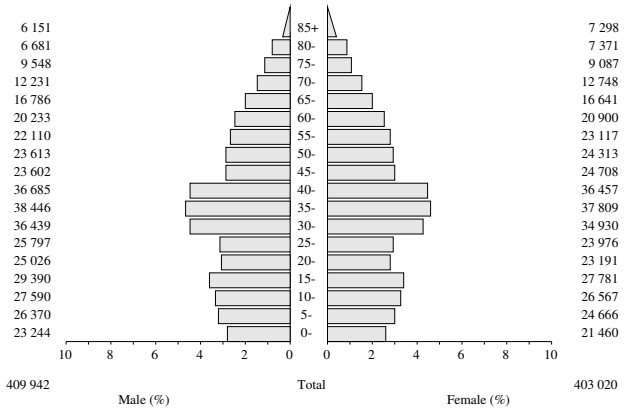
The Villa Clara Cancer Registry is part of the National Cancer Registry (NCR) of Cuba. The registry was created in 1994 and covers the population of Villa Clara Province, which has an area of 8413 km^2. At the 2011 census, the province's population was 798 000, representing 7% of the total population of Cuba. The male-to-female ratio is 1.01:1, and 74% of the population lives in urban areas.

CANCER CARE FACILITIES

The public health system provides free universal coverage at all levels, based on extended primary care. Oncology services are available, with a total of 22 oncologists in the area. The oncology unit of the Provincial University Hospital provides specialized diagnosis and treatment through radiotherapy, chemotherapy, oncological surgery, and nuclear medicine services. There is also a haematology–oncology unit in the Paediatric Hospital.

REGISTRY STRUCTURE AND METHODS

Cancer has been a reportable disease in Cuba since mandatory reporting was first legislated in 1986. The registry's data processing, coding, and database maintenance are performed under contract with the Central Offices of the NCR. Data collection is passive, consisting of receiving reports from hospitals. In the provincial health statistics department, the reports are double-checked to detect any possible duplicates. All data are rigorously computer-checked for validity and consistency, and routine checks are regularly conducted on the files. Data quality is assured by matching pathology reports with hospital registrations for cases in which diagnosis was based on histological confirmation. Other data sources include details of all death certificates. The Villa Clara Cancer Registry adheres to IACR definitions and coding recommendations. All data were coded using ICD-O-1 until 2007, when the registry switched to ICD-O-3.



USE OF THE DATA

The registry produces regular statistical reports and overviews of its accumulated data. The information is used to monitor disease burden, to assess the impact of cancer control efforts, and as a resource for cancer research.

§Includes 5 cases of unknown age

§Includes 3 cases of unknown age

Ecuador, Cuenca

REGISTRATION AREA

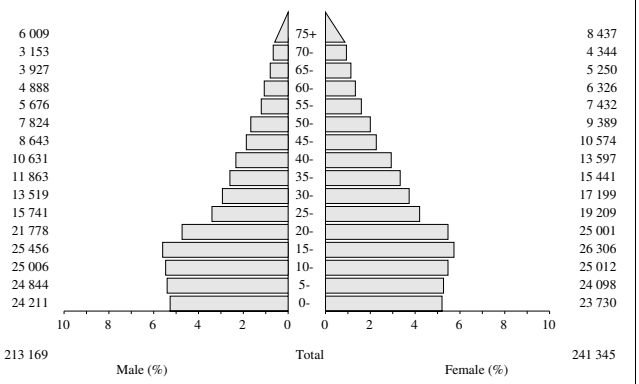
The Cuenca Tumor Registry covers the population of Cuenca Canton (which has an area of about 120 km^2). About 73% of residents live in urban areas. Cuenca Canton is located 2550 m above sea level. The average temperature of the area is 15 °C.

CANCER CARE FACILITIES

The main cancer care facility in the area is the Institute of Cancer SOLCA-Cuenca.

REGISTRY STRUCTURE AND METHODS

The registry began operating in November 1996. Its staff consists of a coordinator and two registrars. The registry gathers information from hospitals, clinics, pathology laboratories, the Institute of Cancer SOLCA-Cuenca, and the National Institute of Statistics and Census. The registry receives technical assistance from the National Cancer Registry in Quito and also cooperates with public health institutions, private pathology laboratories, and doctors in private practice. Data are actively collected from nine pathologists and haematologists, seven hospitals, and 36 clinics and private practices. Quality assurance is performed through internal consistency analysis, the establishment and verification of the data with the primary source, and the use of IARC tools and software.



USE OF THE DATA

The registry publishes its results in an incidence report that is distributed to public health authorities, institutions, health professionals, and the general public. Five such reports have been published to date. This published information is intended to serve as a reliable reference for policy-making, planning, and public health programmes, and as a basis for epidemiological and clinical research. It is also a source of information for the development of presentations by professionals.

Ecuador, Quito

REGISTRATION AREA

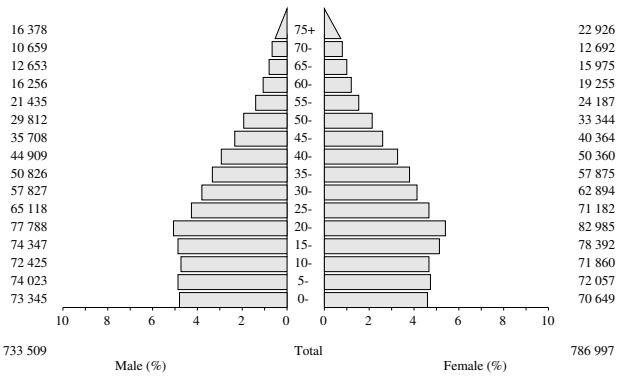
The National Cancer Registry covers the population of Quito (the capital city of Ecuador), situated 2810 m above sea level. Most of the population is Mestizo (of mixed Spanish and Amerindian ancestry). The registry is funded by a private organization: Sociedad de Lucha contra el Cáncer del Ecuador (SOLCA).

CANCER CARE FACILITIES

The city's health care facilities include nine general hospitals run by the social security system and the Ministry of Health, three private hospitals, and 50 private clinics. Most of the human and technological resources for the diagnosis and treatment of cancer are concentrated in the city. Approximately one third of patients are treated at the oncological hospital belonging to SOLCA. The city has five radiotherapy units, 80 pathologists, and several haematologists.

REGISTRY STRUCTURE AND METHODS

The registry staff consists of a director (who specializes in epidemiology), an epidemiologist, and four full-time registrars. Data collection is active, and the registry's primary data sources are pathology reports from public and private laboratories, medical records, hospital discharge records, and death certificates. The 80 pathologists in the city collaborate voluntarily and enthusiastically with the registry. There is systematic control for duplicate cases, as well as validation of the information through quality and consistency checks. Death certificates are matched with registered cases to update the information. The registry is part of the National Statistical System; and as such, it is subject to all applicable rules of confidentiality. The registry has promoted the creation of cancer registries in other Ecuadorian cities, and monitors their activities; there are now registries in the cities of Guayaquil, Cuenca, Portoviejo, Loja, and Machala.



USE OF THE DATA

The registry information is regularly used by Ecuadorian researchers, and is an important source of data for project monitoring and cervical cancer screening. The National Cancer Registry publishes its data on a regular basis. To date, 14 publications have been released, the most recent of which reported on cancer incidence in Quito during the period from 2003 to 2005.

§Includes 83 cases of unknown age

§Includes 96 cases of unknown age

France, Martinique

REGISTRATION AREA

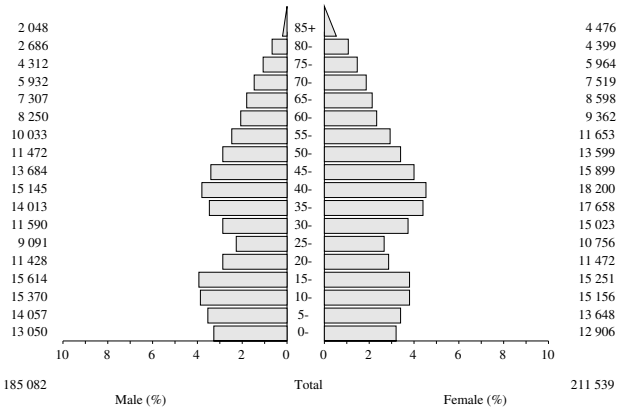
The Martinique Cancer Registry covers the urban (98%) and rural (2%) population of the Caribbean island of Martinique, an overseas region of France.

CANCER CARE FACILITIES

The population is covered by national health insurance complemented by optional private insurance. Martinique's diagnostic and treatment facilities include two pathology laboratories, a haematology laboratory, two public hospitals with facilities located throughout the region – including a radiation oncology service at the CHR (Regional Hospital) – and two private clinics. There is centralized organized screening for breast, colorectal, and cervical cancers, and there is a National Cancer Plan and Programme at the regional and public health levels.

REGISTRY STRUCTURE AND METHODS

A legal framework has been established for the registration, confidentiality, and encryption of data, as well as for informed consent. Encrypted data are transmitted to the French network of cancer registries (FRANCIM). The registry is financed by the French Institute for Public Health Surveillance and the CHU (University Hospital) of Martinique in Fort-de-France. The registry staff includes a managing registrar, a registrar, a biostatistician, a clinical research coordinator, several clinical research associates, and two secretaries. Data collection is both passive and active. Data are received from the Sun Laboratory of Pathology and from health insurance coverage of long-term illness. Patient records are reviewed actively. Quality control procedures are performed as recommended by FRANCIM, in accordance with IARC Technical Report No. 19: *Comparability and Quality Control in Cancer Registration*. The consistency of the data is also checked as recommended by FRANCIM.



USE OF THE DATA

The registry publishes a report on cancer in Martinique every 5 years. Registry data are used for research and included in publications regarding specific issues. The information is also provided to health authorities and used to evaluate health services and the impact of organized screening programmes (particularly those for breast, colorectal, and cervical cancers). The registry's results are interpreted for a variety of purposes (with a special interest in health risks), such as measuring the impact of environmental pollutants (pesticides) on the incidence of cancer or in the workplace, and measuring the impact of new cancer treatments on survival.

Jamaica, Kingston and St Andrew

REGISTRATION AREA

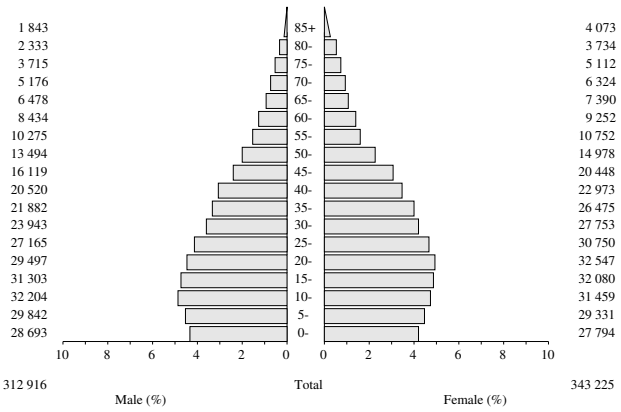
The Caribbean island country of Jamaica has a total area of 11 424 km^2. At the 2011 census, the national population was 2.7 million. Jamaica's capital city is Kingston. The Jamaica Cancer Registry (Kingston and St Andrew) covers the adjacent parishes of Kingston and St Andrew (KSA), which have a combined area of 480 km^2 in the south-eastern region of the island and are jointly governed by the Kingston and St Andrew Corporation (KSAC). The registration of cancer cases in Jamaica is restricted to KSA, which is predominantly urban and accounts for 25% of the national population. The Jamaican population consists primarily of individuals of African ancestry (92.1%) but also includes individuals of East Indian, Chinese, European, and mixed ancestry.

CANCER CARE FACILITIES

The residents of KSA have widespread access to a range of general and specialist health care providers, including oncologists. Health insurance coverage is variable, predominating among the middle and upper income classes. Public health care does not require insurance coverage.

REGISTRY STRUCTURE AND METHODS

The registry is housed in the Department of Pathology at the University of the West Indies; its funding is provided solely from the department's university budget. The routine work of the registry is carried out by two research nurses who actively collect data from public, private, and university pathology laboratories; public and private hospitals; radiotherapy treatment facilities; and private practitioners. Cancer is not a legally reportable disease in Jamaica. Registry data are recorded on a cancer registration card, filed by site and year of diagnosis, and verified by the registry's pathologists. Cases are also filed alphabetically by patient name to avoid duplication. Cases are registered more than once only when there is more than one primary malignancy as confirmed by microscopy. All cases are coded and entered into an electronic database (CanReg5). The registry's limited human and capital resources prevent the routine follow-up of patients, and mortality data are not routinely collected.



USE OF THE DATA

The registry publishes regular 5-year cancer incidence reports, as well as papers dedicated to more detailed evaluations of the incidence and demographic trends of specific cancers.

Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on the 2001 census carried out by the Statistical Institute of Jamaica, making allowances for births and deaths. It was not possible to estimate migration into and out of the registration area.

NOTES ON THE DATA

*No official mortality data. No DCO registrations.

10 MAJOR CANCERS, ASR (WORLD) PER 100 000

Male		Female	
Prostate	77.4	Breast	43.6

USA, Puerto Rico

REGISTRATION AREA

The Puerto Rico Central Cancer Registry (PRCCR) covers all 78 municipalities of Puerto Rico, including the islands of Vieques and Culebra. About 40% of residents live in urban areas. In 2010, Puerto Rico had a population of approximately 3.7 million, primarily of Hispanic origin (98%).

CANCER CARE FACILITIES

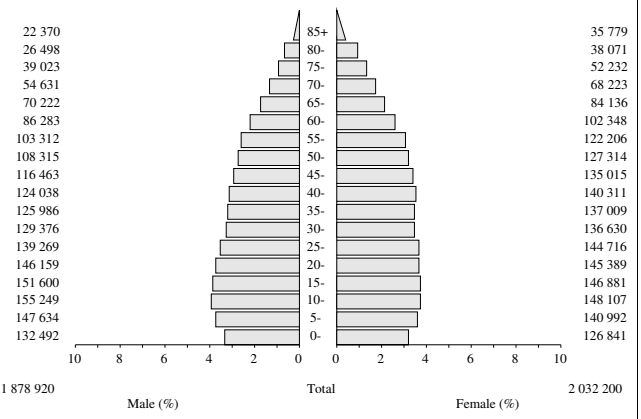
Puerto Rico's medical facilities include hospitals, primary health centres, radiotherapy and chemotherapy facilities, surgical centres, physicians' offices, and pathology laboratories. Cancer patients are referred by primary and secondary care facilities to hospitals in the metropolitan areas of San Juan, Ponce, Mayagüez, and Fajardo. The main medical centre is located in the city of San Juan. An undetermined number of patients also seek medical care on the United States mainland.

REGISTRY STRUCTURE AND METHODS

The registry is located at the University of Puerto Rico Comprehensive Cancer Center and is financed by United States federal and state funds. Since 1997, the PRCCR has been part of the United States National Program of Cancer Registries (NPCR). The registry has 22 full-time employees and four units: Case Finding, Quality Control/Case Processing, Education and Training, and Information Technology. Cancer has been a reportable disease in Puerto Rico since 1951. In 2010, a new law was passed to increase the PRCCR's authority and formalize electronic reporting. Active case finding is performed in general and oncology hospitals, pathology laboratories, and the Vital Statistics Office. The death registration system is adequate and complete, and death certificates are required as a legal document. Currently, 95% of institutions report electronically.

INTERPRETING THE RESULTS

Estimating the number of undiagnosed or unregistered cases is difficult due to the high frequency of migration between Puerto Rico and the United States mainland. However, Puerto Rico has a wide range of diagnostic facilities, and the PRCCR has data exchange agreements with the states of Florida, New Jersey, New York, and Texas to help identify cases diagnosed and/or treated outside of Puerto Rico. Therefore, it is unlikely that many cases are missed. Data from the PRCCR are submitted annually for inclusion in United States cancer statistics reports.



USE OF THE DATA

The various uses of PRCCR data include programme planning and evaluation, research, cluster investigations, annual reports, and special reports. The PRCCR often participates in academic activities to disseminate and promote the use of the data among stakeholders. The PRCCR also collaborates in national and international projects.

SOURCE OF POPULATION

Based on the 2000 national census carried out by the United States Census Bureau, making allowances for births and deaths. It was not possible to estimate migration into and out of Puerto Rico.

§Includes 60 cases of unknown age

§Includes 51 cases of unknown age

Uruguay

REGISTRATION AREA

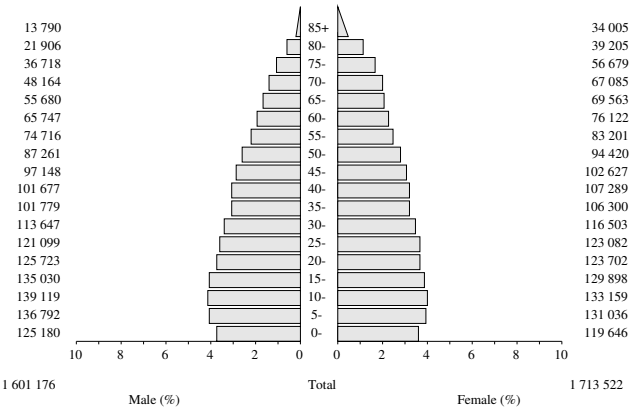
The National Cancer Registry of Uruguay has nationwide coverage (19 departments over an area of 176 065 km^2) of Uruguay's population of 3.4 million (47.8% male and 52.2% female). The population is mainly of Caucasian ethnicity (96.9%), and the majority of residents (95.1%) live in urban areas. In *Cancer Incidence in Five Continents, Volume III*, only information from the capital city (Montevideo) was published.

CANCER CARE FACILITIES

Approximately 95% of the population has full access to either the public health system (ASSE) or the private system. Cancer diagnosis, treatment (including surgery, radiation therapy, and drugs), follow-up, and palliative care are available to all users of both systems. There are more than 50 oncology services (half of them located in Montevideo) and eight radiation therapy services (four public, four private). In 2005, the National Cancer Control Program (PRONACCAN) was created to coordinate all actions against cancer.

REGISTRY STRUCTURE AND METHODS

The registry was created by law in 1984. Since 2002, it has been run within the framework of the Epidemiologic Surveillance Program (PVE) of Uruguay's Comisión Honoraria de Lucha contra el Cáncer. The registry staff is organized in three technical units and consists of 30 registrars, three administrative employees, and a director. Confidentiality agreements are signed by all staff members. Documents and databases are protected according to national and international guidelines. Data collection is mainly active, through incidence reports filed by the registrars in hospitals, laboratories, and other information sources. Death certificates are also available to the registry. Quality control procedures are performed both manually and automatically using IARC's and the registry's own software. Uruguay has screening programmes for colorectal, cervical, and breast cancers, although their coverage is still low. The significant number of older patients diagnosed at very advanced stages of disease results in high rates of non-microscopically-verified diagnosis.



USE OF THE DATA

Registry data are regularly reported in the publication *Incidence and Mortality Atlas: 5-Year Data*, and the registry provides its cooperation for various research projects and scientific publications. Specific reports are prepared in response to requests from clinicians, researchers, authorities, and the general public.

§Includes 7 cases of unknown age

Canada

REGISTRATION AREA

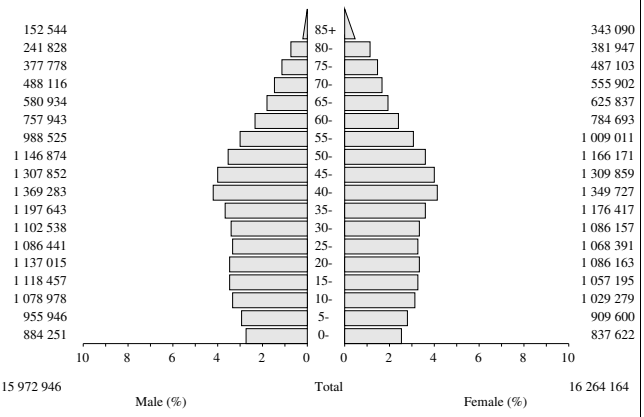
The Canadian Cancer Registry (CCR) covers all of Canada, the second largest country in the world, with an area of 9 984 670 km^2. The country consists of 10 provinces and three territories. At the 2011 census, the population of Canada was 34.5 million, with 22.7% of residents aged less than 20 years and 14.4% aged 65 years or more. Approximately 80% of residents live in urban areas, and almost one third of the population is concentrated in the metropolitan areas of Toronto, Montreal, and Vancouver. Canada is a multicultural society. At the 2006 census, members of visible minorities constituted 16.2% of the total population and the Aboriginal population constituted 3.8% of the total population. English is the mother tongue of 55.7% of the population, and French is the mother tongue of 21.6%.

REGISTRY STRUCTURE AND METHODS

Statistics Canada has collected population-based cancer incidence data since 1969. Since 1992, these data have been compiled in the person-oriented CCR, which replaced the event-oriented National Cancer Incidence Reporting System. The CCR provides the national incidence and survival information required for cancer control. The CCR is a dynamic database of all Canadian residents (living and dead) who have been diagnosed with cancer. It is a collaborative effort between Statistics Canada and the 13 Canadian provincial and territorial cancer registries. The CCR's purpose is to record standardized, comparable cancer incidence and survival data for each newly diagnosed primary cancer. The patient data are linked annually to the Canadian Human Mortality Database, so that the date, place, and cause of death for every cancer patient are eventually known. In addition to cancer incidence, the CCR also records patient characteristics as well as the nature and frequency of their tumours. The CCR uses specialized internal record linkage software for detecting duplicate records and for clearing death records.

INTERPRETING THE DATA

In Canada, health care delivery is under provincial/territorial jurisdiction. As a result, each province and territory determines which screening programmes to offer. Common screening initiatives include programmes for the detection of breast, cervical, and colorectal cancers.



USE OF THE DATA

The annual publication *Canadian Cancer Statistics* is a collaborative effort between governmental and nongovernmental organizations to produce current estimates and future projections of cancer incidence and survival. Research data centres provide researchers with access to the CCR microdata in a secure setting.

Canada, Alberta

REGISTRATION AREA

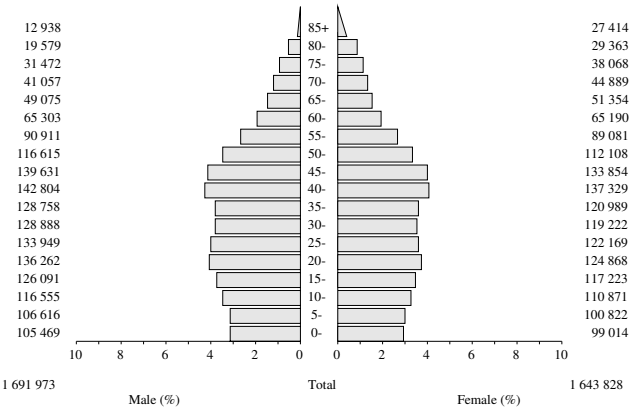
Alberta is one of the Prairie Provinces of Canada, with an area of 661 688 km^2. The Alberta Cancer Registry (ACR) covers the province's multiethnic population, which numbered 3.6 million at the 2011 census, with 80% living in urban areas.

CANCER CARE FACILITIES

Alberta has universal health care, which is provided and administered by Alberta Health Services (AHS). Many hospitals in Alberta's cities provide surgery and chemotherapy to cancer patients, and there are 17 cancer centres. Two tertiary cancer centres and one associate cancer centre provide radiotherapy, chemotherapy, and limited surgical procedures. The other cancer centres (three associate centres and 11 community centres) provide chemotherapy services.

REGISTRY STRUCTURE AND METHODS

AHS Cancer Care maintains the ACR, which operates out of the tertiary centres. The registry staff includes a director, two supervisors, two programmers, three quality assurance/staging specialists, 20 cancer registrars, and four support staff members. The registry's activities involve patient registration, coding and staging cancer cases, research projects, quality assurance reviews (both computerized and manual), passive follow-up with Alberta Vital Statistics, and case ascertainment. Alberta's Regional Health Authorities Act mandates the registration of all reportable cancers. The ACR uses a passive case finding approach: all pathology, cytology, and operative reports (and some records such as scans and X-rays) with a mention of cancer are forwarded to the registry. Alberta has an electronic medical record system, which has improved the accuracy of patient demographics and allowed for timelier access to clinical reports. A monthly electronic linkage to Alberta Vital Statistics identifies all cancer patients who die in Alberta. Mechanisms are in place to evaluate the quality of data collected by the registry for completeness, accuracy, and timeliness. The ACR achieved Gold Certification from the North American Association of Central Cancer Registries (NAACCR) from 1998 to 2000 and from 2002 to 2009, and achieved Silver Certification in 2001.



USE OF THE DATA

ACR cancer incidence and mortality data are published annually. Research projects involving patient contact must be approved by the Research Ethics Board. Every year, the ACR fulfils more than 100 requests for information, including requests for information to be used in collaborative studies with other agencies and organizations. The registry is also an important source of information to AHS for planning its services and programmes, which include screening programmes for breast, cervical, and colorectal cancers.

Canada, Alberta (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on 2001 and 2006 national census data provided by Statistics Canada. Final intercensal estimates are used for 2003 to 2005, and final postcensal estimates for 2006 and 2007.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Canada, British Columbia

REGISTRATION AREA

The British Columbia Cancer Registry covers the Canadian province of British Columbia. A considerable portion of the province is mountainous and sparsely populated, with most of its population concentrated in the south-western corner. Immigration to British Columbia has increased in recent years. At the 2006 Canadian census, it was estimated that 27.2% of British Columbia residents had immigrated to Canada; of these, one in six had immigrated since the 2001 census. Most immigrants to British Columbia come from Asia, particularly from China, India, the Philippines, and the Republic of Korea. At the 2006 census, 25.5% of British Columbians identified themselves as belonging to a visible minority, of which the largest groups were Chinese and South Asian. Aboriginal people constituted 6.1% of the population.

CANCER CARE FACILITIES

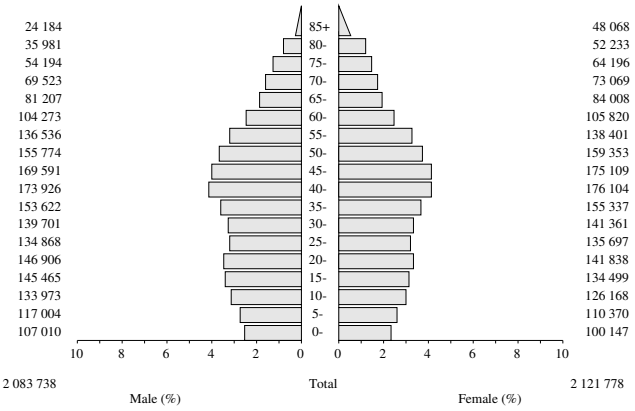
Health care in British Columbia is delivered by a publicly funded system. Cancer diagnostic services are provided by general hospitals and specialty clinics. Cancer therapy is provided through a mix of dedicated cancer facilities and general hospitals. The British Columbia Cancer Agency (BCCA) operates six regional cancer centres. Radiation therapy is exclusively provided through these regional centres, which also provide approximately 50% of cancer chemotherapy services.

REGISTRY STRUCTURE AND METHODS

The registry is part of a combined population-based registry and clinical database maintained by the BCCA. Reporting of cancer cases to the registry is mandatory, and the registry is permitted under provincial legislation to obtain information about cancer diagnoses for surveillance and research purposes.

INTERPRETING THE RESULTS

The BCCA operates the Screening Mammography Program of British Columbia, the Cervical Cancer Screening Program, and the Hereditary Cancer Program, which have all had an impact on the early detection of cancer. Prostate-specific antigen (PSA) screening for prostate cancer became common in the early 1990s, although it is not a publicly funded service.



USE OF THE DATA

The registry serves as a source of cases for surveys and case–control studies; provides outcome data for cohort studies; and is frequently linked with other data sources for epidemiological, health services, and outcomes research. Surveillance reports of cancer statistics are regularly generated and are used for planning services and facilities, for budgeting, and for monitoring systems performance.

SOURCE OF POPULATION

Based on 2001 and 2006 national census data provided by Statistics Canada. Final intercensal estimates are used for 2003 to 2005, and final postcensal estimates for 2006 and 2007.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Canada, Manitoba

REGISTRATION AREA

The Manitoba Cancer Registry covers the population of Manitoba, a province located in central Canada. Manitoba is bordered to the east by the province of Ontario, to the west by the province of Saskatchewan, to the north by the territories of Nunavut and the Northwest Territories, and to the south by the USA (the states of North Dakota and Minnesota). The province covers an area of 649 950 km^2. At the 2001 census, 72% of the population lived in urban areas, with 60% living in the provincial capital of Winnipeg. Approximately 13.6% of all residents were Aboriginal (60.2% Native American, 37.9% Métis, and 2.3% Inuit). Of Manitobans who had immigrated to Canada, a similar proportion had immigrated from Europe (47.5%) and Asia (30.3%). The majority of Manitobans reported British (36.7%), French (12.6%), or other European (48.0%) heritage.

CANCER CARE FACILITIES

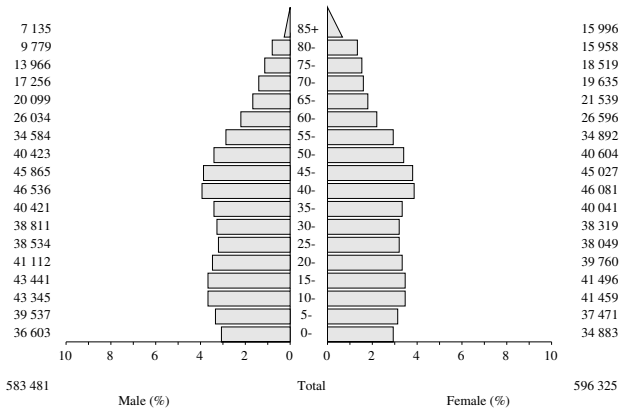
CancerCare Manitoba is a provincial cancer agency with the mandate of coordinating all aspects of cancer control. Direct patient care involves the provision of treatment services, including two outpatient radiation therapy centres (one in Winnipeg and the other in rural Brandon) along with chemotherapy. CancerCare Manitoba also partners with other community care facilities to deliver cancer care – primarily chemotherapy – in local communities.

REGISTRY STRUCTURE AND METHODS

The registry became fully population-based and was mandated by law in 1956, but it has cases dating back as far as 1937. The registry is funded through CancerCare Manitoba by the provincial health department. The registry staff includes a manager, 10 cancer registrars, three clerks, and an administrative assistant. The epidemiology section of the provincial health department (which includes four epidemiologists, eight analysts, and three project managers) provides support to the registry and is extensively involved in research. Multiple sources are used for case ascertainment. The registry has strict quality control procedures in place and has been certified by the North American Association of Central Cancer Registries (NAACCR) for the past 8 consecutive years.

INTERPRETING THE RESULTS

The Manitoba cancer statistics presented in this volume may have been influenced by diagnostic and early detection technologies. A provincial breast screening programme was established in 1995, a cervical screening programme in 1999, and a colorectal screening program in 2007.



USE OF THE DATA

Registry data are used to address questions relating to surveillance, research, evaluation, and planning, as well as for teaching purposes and to provide diagnostic confirmation and treatment-related information to health care providers.

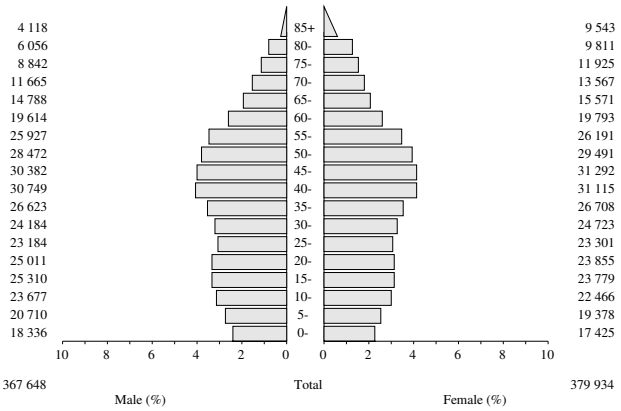
Canada, New Brunswick

REGISTRATION AREA
The New Brunswick Provincial Cancer Registry (NBPCR) covers the population of the Canadian province of New Brunswick, which was estimated at the most recent census (2006) to be 730 000.

CANCER CARE FACILITIES
Medical treatment of cancer in New Brunswick focuses on four modalities: surgery, systemic therapy, radiation therapy, and supportive services. Paediatric oncology cases are generally referred to the neighbouring provinces of Nova Scotia or Quebec for initial consultation with a paediatric oncologist. There are two tertiary radiation-based cancer centres in the southern part of the province, in the cities of Moncton and Saint John.



REGISTRY STRUCTURE AND METHODS
The NBPCR is a population-based central cancer registry located in Saint John (the province's largest city). The registry is funded by the New Brunswick Department of Health and has been overseen by the New Brunswick Cancer Network since January 2008. The registry has used the Collaborative Staging System to capture cancer stage for selected sites (breast, lung, prostate, and colorectum) since 2008. The College of American Pathologists (CAP) Cancer Protocols and Checklists have been endorsed as the cancer pathology reporting standard in New Brunswick since 2009. Since September 2008, several major changes have been implemented within the New Brunswick health care system to improve the efficiency of health care delivery. As part of this process, the province's eight former Regional Health Authorities were amalgamated into two new Regional Health Authorities. In September 2010, the province enacted new privacy legislation (the Personal Health Information Privacy and Access Act [PHIPAA]) that is specifically geared to the health sector and applies to the collection, confidentiality, correction, use, disclosure, retention, and destruction of personal health information.

INTERPRETING THE RESULTS
The New Brunswick Breast Cancer Screening Program was rolled out in 16 facilities in 1995, targeting asymptomatic women aged 50–69 years. Full implementation of the New Brunswick Cervical Cancer Prevention and Screening Program is anticipated by 2013–2014.

USE OF THE DATA
The registry prepares a 5-year report on cancer incidence and mortality, highlighting trends and changes by health region. Data from the registry have also been used to support the indicators for cancer system performance published by the Canadian Partnership Against Cancer (CPAC).

Average annual person-years by sex and age group

SOURCE OF POPULATION
Based on 2001 and 2006 national census data provided by Statistics Canada. Final intercensal estimates are used for 2003 to 2005, and final postcensal estimates for 2006 and 2007.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

Canada, Newfoundland and Labrador

REGISTRATION AREA

The Newfoundland and Labrador Provincial Tumour Registry covers the Canadian province of Newfoundland and Labrador. In July 2013, the estimated provincial population was 527 000.

CANCER CARE FACILITIES

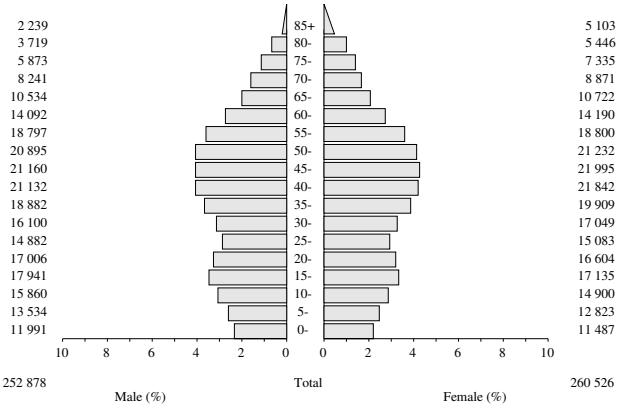
The Newfoundland and Labrador Cancer Care Program is responsible for four cancer centres in the province: the Dr. H. Bliss Murphy Cancer Centre in St. John's (the province's capital city) and three regional centres in Gander, Grand Falls-Windsor, and Corner Brook. Several services, such as radiation therapy, are only available in St. John's. The Cancer Care Program is also responsible for the provincial systemic therapy budget and oversees chemotherapy delivery in various hospitals across the province.

REGISTRY STRUCTURE AND METHODS

The registry is part of the provincial Cancer Care Program of Eastern Health (Newfoundland and Labrador's government health organization), formed in 2005. The registry is located within the Dr. H. Bliss Murphy Cancer Centre in St. John's and is staffed by a manager, a part-time programmer analyst, and four full-time health records professionals. The registry uses an electronic pathology (E-Path) reporting system and receives reports from six pathology laboratories, through an HL7 interface. Each report is filtered using an ICD-O-3 auto-coding engine. The automated filtering logic examines the topography and morphology codes and then selects reports for submission to the registry based on registry reporting requirements. E-Path reporting has improved the timeliness, completeness, and consistency of the registry's pathology information. The registry has also implemented a death clearance process and performs active follow-up of all patients, which has greatly improved case ascertainment.

INTERPRETING THE RESULTS

Cervical cancer screening is carried out throughout the province, mainly by family physicians on an opportunistic basis. A cervical cytology registry exists to track results and report indicators. Breast cancer screening programmes exist in three regions of the province, but full provincial coverage has not yet been achieved. An organized colorectal cancer screening programme (using the faecal immunochemical test [FIT]) was launched in 2012. The programme is still being phased in and to date is available in two regions of the province. Full provincial coverage is anticipated within 3 years of the initial launch.



USE OF THE DATA

Registry data are used for a variety of purposes, including health care planning, evidence-based decision-making, research, and cross-jurisdictional (intraprovincial, pan-Canadian, and international) comparisons. Data are also submitted to various organizations, including Statistics Canada (for inclusion in the Canadian Cancer Registry), the North American Association of Central Cancer Registries (NAACCR), and the Canadian Partnership Against Cancer (CPAC). Data from the registry are included in the annual publication *Canadian Cancer Statistics* and in CPAC's *Cancer System Performance Reports* and *System Performance Special Focus Reports*.

Canada, Northwest Territories

REGISTRATION AREA

The Northwest Territories Cancer Registry covers the entire Canadian territory of the Northwest Territories. The territory is extremely sparsely populated, with a population at the 2012 census of approximately 43 000, spread over an area of more than 1.3 million km^2. Approximately half of the territory's residents live in the capital city, Yellowknife; the remainder live in 32 small communities and regional administrative centres spread throughout the territory and ranging in population at the 2012 census from 50 to 3600. Of the territory's total population, 51% of residents are Aboriginal (including First Nations, Inuit, and Métis). The majority of non-Aboriginal residents (71%) live in the capital, whereas the majority of Aboriginal residents (79%) live in small communities and regional centres.

CANCER CARE FACILITIES

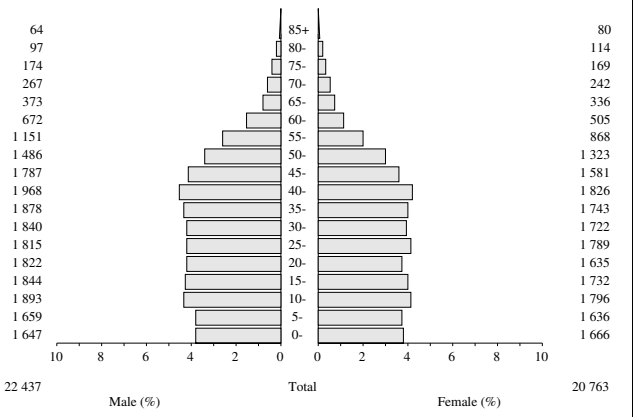
The Stanton Territorial Hospital in Yellowknife provides chemotherapy services and basic cancer surgeries. For all other cancer services, patients travel to the Cross Cancer Institute in Edmonton, Alberta.

REGISTRY STRUCTURE AND METHODS

Reporting of all cancer cases to the registry is mandatory under the territory's Public Health Act. Registry data are assembled and verified by a senior disease registry officer in the Population Health Division of the Northwest Territories Department of Health and Social Services.

INTERPRETING THE RESULTS

There were no organized screening programmes in the territory until a mammography programme was implemented in 2010. Incidental screening has been available for longer, but there are no data on coverage rates until 2007 for Pap testing, 2009 for faecal immunochemical testing (FIT) and faecal occult blood testing (FOBT), and 2010 for mammography.



USE OF THE DATA

Registry data are used for analysis and reporting. Due to the small population of the Northwest Territories, cancer rates are calculated as 3- or 5-year averages, and the territory publishes a cancer report every 10 years, so that data can be aggregated to provide the statistical power necessary for comparative analysis. The most recent report, *Cancer in the Northwest Territories 2001–2010*, was released in early 2014 and includes Northwest Territories cancer incidence and mortality statistics, as well as information about cancer screening rates, cancer risk factors, and programmes and services offered in the Northwest Territories.

Canada, Northwest Territories (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on 2001 and 2006 national census data provided by Statistics Canada. Final intercensal estimates are used for 2003 to 2005, and final postcensal estimates for 2006 and 2007.

NOTES ON THE DATA

*Rates based on low numbers due to small population. High MV%. Low DCO rates.

Canada, Nova Scotia

REGISTRATION AREA

The Nova Scotia Cancer Registry covers the province of Nova Scotia, which is located on Canada's east coast. Other than an isthmus connecting Nova Scotia to the adjacent province of New Brunswick, the province is completely surrounded by the Atlantic Ocean. Nova Scotia has an area of approximately 55 940 km^2, and at the 2011 national census its population was 922 000, with 65% of residents living within a census metropolitan area.

CANCER CARE FACILITIES

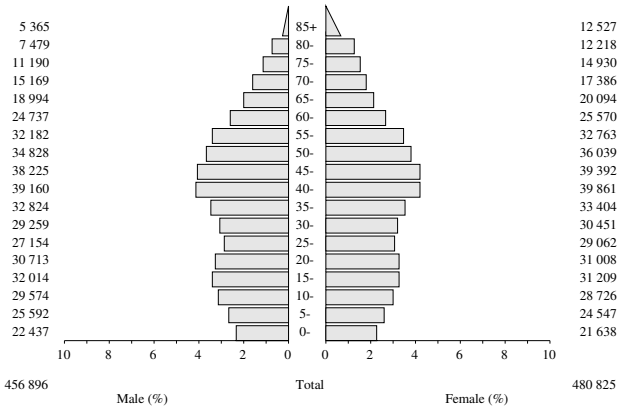
Nova Scotia residents are covered by a publicly funded comprehensive health insurance programme, which includes family physician visits and hospital-based care, accessed through a unique, lifetime-assigned health card number. Nine district health authorities, funded by the Nova Scotia Department of Health and Wellness (DHW), manage health care services (e.g. hospitals, home care, and public health) in their assigned geographical districts. Cancer care is highly centralized and is coordinated through a DHW provincial cancer programme. Two main cancer centres offer specialized treatment (e.g. radiation treatment services), with numerous satellite clinics throughout the province for specialist oncology referral, chemotherapy, and follow-up.

REGISTRY STRUCTURE AND METHODS

Nova Scotia's population-based cancer registry is operated as part of the provincial cancer programme funded by the government; 14 programme staff members (registrars, analysts, and administrators) work with abstraction staff members located at cancer centres to collect data. Cancer has been a reportable disease in Nova Scotia since 1964, and multiple reporting sources (e.g. pathology laboratories, hospital records, and cancer centre referrals) are used to ensure completeness. As of 2004, standardized stage data are now part of routine data abstraction. Only limited treatment data are collected, but expansion of this function is planned. Routine linkage with vital statistics death data began with cases diagnosed in 1969. Nova Scotia follows the standards outlined by the Canadian Council of Cancer Registries.

INTERPRETING THE RESULTS

Nova Scotia has organized, population-based screening programmes for several cancers. The cervical cancer screening programme began in 1992, the breast cancer screening programme began in 1991 and was phased in over time, and the colorectal cancer screening programme began in 2009 and is still being phased in.



USE OF THE DATA

Registry data are reported annually to the Canadian Cancer Registry and submitted to the North American Association of Central Cancer Registries (NAACCR) for certification and inclusion in the publication *Cancer in North America*. Provincial data (e.g. incidence, mortality, and survival data) are reported annually to local stakeholders and used for programme evaluation and planning purposes. Data are frequently made available for use in approved studies.

SOURCE OF POPULATION

Based on 2001 and 2006 national census data provided by Statistics Canada. Final intercensal estimates are used for 2003 to 2005, and final postcensal estimates for 2006 and 2007.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

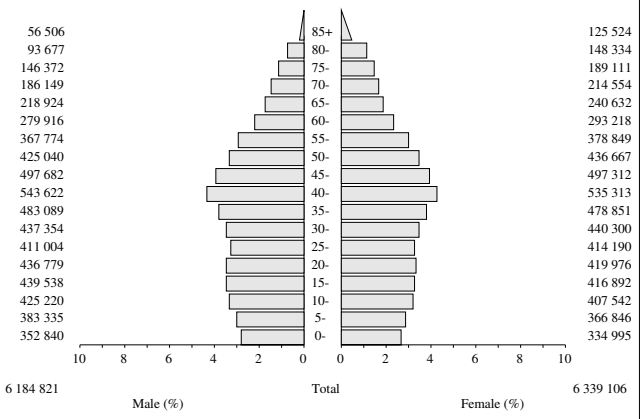
† See note following population pyramid

Canada, Ontario

REGISTRATION AREA
The Ontario Cancer Registry (OCR) covers the entire population of the Canadian province of Ontario.

CANCER CARE FACILITIES
The Ontario cancer care system is organized into Regional Cancer Programs (RCPs) corresponding with the province's 14 Local Health Integration Networks (LHINs). RCPs are networks of health care providers (including regional cancer centres) and stakeholders (including patient groups involved in providing cancer prevention, screening, diagnostic, and treatment services) in the LHINs. Each RCP is led by a Cancer Care Ontario Regional Vice President, who also leads that LHIN's regional cancer centre (RCC). Ontario's RCPs were established in 2005 to respond to local cancer issues and needs; to meet provincial quality standards for cancer services locally; and to improve wait times, access, and quality of services by managing and coordinating care across local and regional providers – including hospitals, Community Care Access Centres (CCACs), public health care facilities, and primary care facilities.



REGISTRY STRUCTURE AND METHODS
The OCR is a computerized database of information about all Ontario residents who have been newly diagnosed with cancer (incidence data) or who have died of cancer (mortality data). All new cases of cancer are registered, except cases of non-melanoma skin cancer. Close to 400 000 records are submitted to the OCR each year. Cancer is not a reportable disease in Ontario; therefore, submission of data to the OCR is voluntary.

INTERPRETING THE RESULTS
There are three Ontario-wide cancer screening programmes, for breast, cervical, and colorectal cancer. These programmes are administered by Cancer Care Ontario. The Ontario Breast Screening Program (OBSP) provides screening mammography services for women aged 50–74 years who are at average risk of developing the disease, and for women aged 30–69 years who are at high risk. Women at average risk are offered mammography once every 2 years. The Ontario Cervical Screening Program recommends Pap testing every 3 years (starting at age 21 years) for all women who are or have ever been sexually active. Pap testing can stop at age 70 years for women who have had three or more normal tests in the previous 10 years. Ontario's ColonCancerCheck screening programme offers faecal occult blood testing (FOBT) every 2 years to residents aged 50 years or more who are at average risk.

USE OF THE DATA
OCR data are used for the following purposes: surveillance (examination of trends in cancer incidence and mortality rates and analysis of geographical variation in cancer rates across the province); dissemination of data to the Canadian Cancer Registry at Statistics Canada (annually), the North American Association of Central Cancer Registries (annually), and IARC; population-based epidemiological studies; research studies; linkage of data to other databases, such as the OBSP's Integrated Client Management System; and annual reporting of cancer statistics to the public.

Canada, Prince Edward Island

REGISTRATION AREA

The Prince Edward Island Cancer Registry covers all of the Canadian province of Prince Edward Island, which is situated in the south-west of the Gulf of Saint Lawrence. At the 2011 census, the province's population was 140 000, with 58% of residents living in Charlottetown or Summerside. In 2012, it was estimated that 48.8% of the population was male and 51.2% female. The large majority of the population of Prince Edward Island is of British origin, followed by French origin, with smaller numbers of residents of other European origins.

CANCER CARE FACILITIES

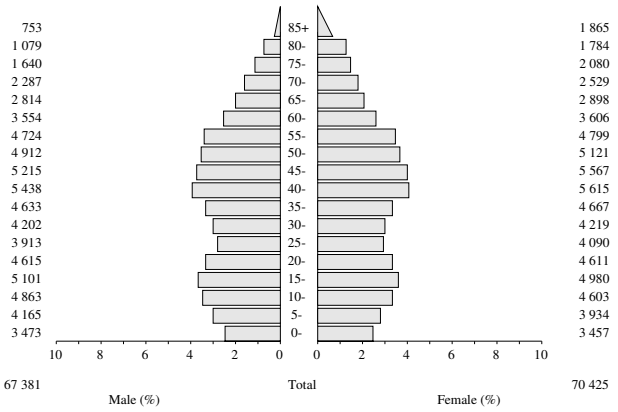
The registry is located in the Prince Edward Island Cancer Treatment Centre at the Queen Elizabeth Hospital in Charlottetown, and is part of Health PEI, the province's health system. The Prince Edward Island Cancer Treatment Centre houses two linear accelerators and provides all radiotherapy services for the province. Medical oncology services are also offered at the centre, as well as in two satellite centres – Prince County Hospital in Summerside and Kings County Memorial Hospital in Montague.

REGISTRY STRUCTURE AND METHODS

The registry began operation in 1969. Cancer is a reportable disease in the province, as per the province's Public Health Act. The registry staff consists of a full-time registry manager and two full-time cancer registrars. The information collected includes demographics, cancer-specific diagnostic information, stage at diagnosis, and some treatment information. The registry's main data source is pathology reports with a diagnosis of cancer, which are received electronically. Approximately 95% of all cancers in Prince Edward Island are captured by this method. Other data sources consist of cancer treatment centre charts, hospital discharge data, death notifications, and notifications from other provinces. The province has an Electronic Health Records system, which has greatly improved the follow-up and trace-back processes for cancer abstracting and has allowed the registry to expand its data collection to include staging on a population basis, starting with the 2009 diagnosis year. Collection of some treatment data also began that year.

INTERPRETING THE RESULTS

The Prince Edward Island Breast Screening Program was established in 1998, and the screening database stores information about screening events. The programme provides these data annually to the Public Health Agency of Canada (PHAC) for inclusion in the Canadian Breast Cancer Screening Database. The Prince Edward Island Colorectal Cancer Screening Program targets men and women at average risk of colorectal cancer and screens individuals every 2 years using the faecal immunochemical test (FIT). This programme was launched provincially in the spring of 2011 and has an uptake of about 15% of the eligible population. Prince Edward Island does not have an organized cervical cancer screening programme, but Pap tests are available through primary health care providers and the Prince Edward Island Pap Screening Clinic. A review of the Pap tests administered from 2009 to 2011 showed that the cervical cancer screening rate in the province was 67%. Prince Edward Island's Cervical Cancer Screening Guidelines were revised in October 2013.



USE OF THE DATA

The report *Prince Edward Island Cancer Trends 1980–2009* was released in 2012. It reports trends in cancer incidence, mortality, and survival in the province.

Canada, Quebec

REGISTRATION AREA

The Quebec Cancer Registry covers the population of the Canadian province of Quebec. Of the province's vast area of 1 667 441 km^2, only 2.3% serves as urban or agricultural land. At the 2011 census, the population of Quebec was 8 million, with 21.6% of residents aged less than 26 years and 15.7% aged 65 years or more. Approximately 80% of residents live in urban areas. French is the mother tongue of 79% of the population, and life expectancy at birth is 79 years for males and 83 years for females.

CANCER CARE FACILITIES

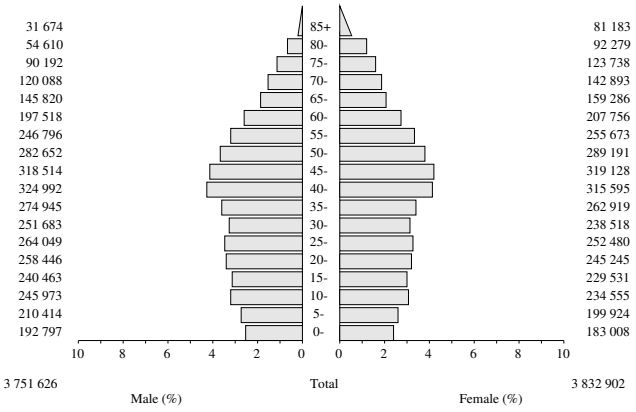
In Quebec, health services have been available to the whole population through a comprehensive public system since 1970. A total of 70 hospital facilities provide diagnosis and treatment of cancer. Of those, 11 offer radiation oncology services.

REGISTRY STRUCTURE AND METHODS

The registry is maintained by Quebec's Ministry of Health and Social Services. Notification of cancer is mandatory under the province's Public Health Act. Before 2011, cancer cases were only reported following hospitalization or a visit to the outpatient surgery unit of a hospital offering general short-term specialized care, or using death certificates. Since 2011, pathology reports have also been used to collect cancer cases. Information about extent of disease, stage, and treatment is not yet collected, but there are plans to begin collecting these types of data for high-priority cancers (i.e. those of the breast, prostate, colorectum, and lung) starting with 2014 cases.

INTERPRETING THE RESULTS

Until 2011, due to the fact that hospitalization data were the primary source of information about cancer cases, three types of cancer not typically requiring hospitalization or outpatient surgery were significantly underreported; about 35% of melanoma cases, 32% of bladder cancer cases, and 33% of prostate cancer cases were not reported to the registry. Since 1997, a breast cancer screening programme has been available for women aged 50–69 years. A pilot project for colorectal cancer screening is under way.



USES OF THE DATA

Registry data are used mainly for monitoring, surveillance, prevention, programme evaluation, and research. Special reports on cancer survival, prevalence, data quality, and projections are published periodically. Specific databases for regional cancer surveillance are produced annually, and a variety of statistics are made available for general and specific purposes.

Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on 2001 and 2006 national census data provided by Statistics Canada. Final intercensal estimates are used for 2003 to 2005, and final postcensal estimates for 2006 and 2007.

NOTES ON THE DATA

*Low MV%. †C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

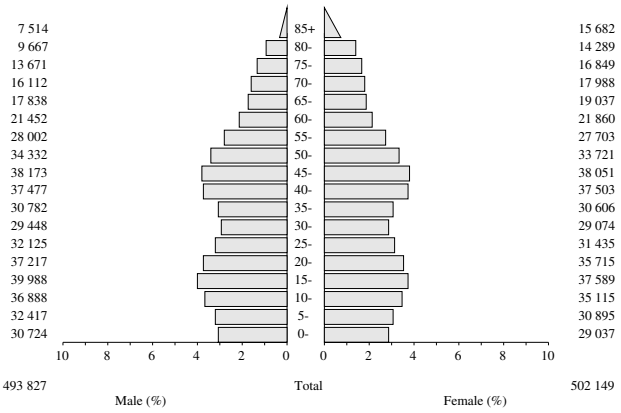
Canada, Saskatchewan

REGISTRATION AREA
The Saskatchewan Cancer Registry covers the population of the Canadian province of Saskatchewan. At the 2006 census, the province's population was 1.1 million, of mixed ethnic origin. Approximately 64% of residents live in cities with more than 5000 inhabitants.

CANCER CARE FACILITIES
The registry is located within the Saskatchewan Cancer Agency, which is responsible for treatment, prevention, early detection programmes, research, and education services. Cancer treatment facilities for chemotherapy and radiotherapy are located in Regina and Saskatoon – the two largest centres in Saskatchewan. There are also outreach programmes for chemotherapy in 16 regional hospitals throughout the province. The population of Saskatchewan is covered by a government-funded universal comprehensive health insurance plan.



REGISTRY STRUCTURE AND METHODS
It is legally mandated by Saskatchewan's Cancer Agency Act that all cancers must be reported to the Saskatchewan Cancer Agency. This mandate results in the ascertainment of approximately 95% of cases. Other case ascertainment strategies, such as notification of deaths by the Vital Statistics agency, result in the capture of the other 5% of cases. The registry is staffed by 14 cancer registrars, two clerks, two supervisors, a coordinator, a data quality specialist, and the provincial leader. The staff members are based at the two treatment centres in Saskatoon and Regina. The registry captures approximately 9000 cancer cases per year, including non-melanoma skin cancers. The registry also uses active follow-up procedures to capture outcomes information. The registry is patient- and case-oriented. Electronic data are available for all cancers diagnosed since 1967. Paper records are available for all cases diagnosed since 1932. Data are coded according to ICD-O-3. Collection of collaborative staging data began in 2005. The registry's quality control procedures include re-abstraction of cases, internal and external audits, and electronic editing. The data are also edited by Statistics Canada and the North American Association of Central Cancer Registries (NAACCR) upon submission to their databases.

INTERPRETING THE RESULTS
The Saskatchewan Cancer Agency operates three population-based screening programmes: the Screening Program for Breast Cancer (SPBC), targeting women aged 50–69 years; the Prevention Program for Cervical Cancer (PPCC), targeting women aged 21–69 years; and the Screening Program for Colorectal Cancer (SPCRC), targeting individuals aged 50–74 years.

USE OF THE DATA
Registry data are used for business and planning purposes, research, outcomes analysis, performance measurement, evaluation of early detection and screening programmes, and statistics. Statistical data are published provincially, nationally, and internationally.

Canada, Yukon

REGISTRATION AREA

The Yukon Cancer Registry covers the population of the Yukon Territory, located in the north-western corner of Canada. The Yukon is bordered to the east by the Northwest Territories, to the south by the province of British Columbia, and to the west by the USA (the state of Alaska). The Yukon constitutes 5% of Canada's total land area, making it the ninth largest of Canada's 10 provinces and three territories. With a population of 30 000 at the 2006 census, the Yukon is the second least populous province or territory in Canada. Whitehorse, the territorial capital, is home to three quarters of the territory's population. There was a 5.9% increase in the territory's population from 2001 to 2006. In 2001, 29% of the population was aged 25–44 years. The Yukon has a low proportion of elderly persons, with only 7.5% of the population aged more than 65 years, compared with 13.7% of the population of Canada as a whole. One quarter of the Yukon's population is of Aboriginal origin.

CANCER CARE FACILITIES

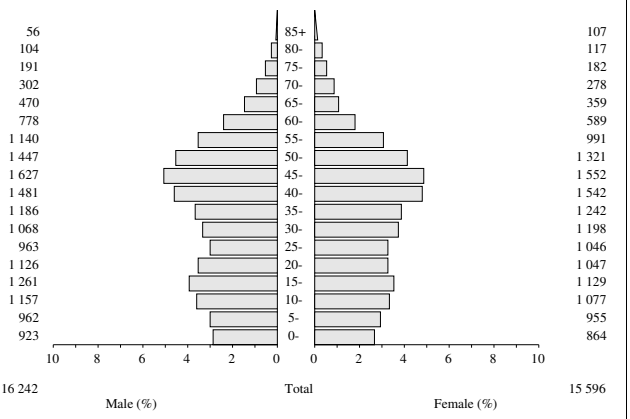
Health programmes and services in the Yukon are provided through health centres and three hospitals. There are no dedicated cancer centres. Specialized cancer services for Yukon residents are provided by visiting specialists and in neighbouring provinces.

REGISTRY STRUCTURE AND METHODS

The registry includes information dating back to 1987. The British Columbia Cancer Agency maintains the Yukon's registry along with its own provincial data.

INTERPRETING THE RESULTS

The Yukon Mammography Program was established in 1990 to reduce breast cancer mortality through early detection. The programme participates in the Canadian Breast Cancer Screening Initiative and reports its results annually. However, it does not contribute to the initiative's national database, due to the lack of computerization of screening records. The British Columbia Cancer Agency's Cervical Cancer Screening Program also evaluates Pap tests performed in the Yukon. Screening is recommended for women aged more than 18 years, but there is no organized programme for the provision of services.



USE OF THE DATA

Registry data are submitted to the national cancer registry maintained by Statistics Canada, at which point duplicate reports and registrations in other Canadian jurisdictions are reconciled.

Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on 2001 and 2006 national census data provided by Statistics Canada. Final intercensal estimates are used for 2003 to 2005, and final postcensal estimates for 2006 and 2007.

NOTES ON THE DATA

*Rates based on low numbers due to small population. High MV%. Low DCO rates.

REGISTRATION AREA

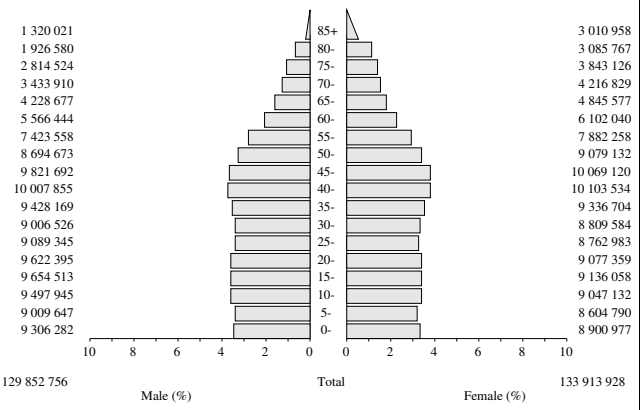
As authorized by the United States Congress, the United States Centers for Disease Control and Prevention (CDC) provides financial and technical support for the National Program of Cancer Registries (NPCR), which includes population-based cancer registries in 45 states, the District of Columbia, Puerto Rico, and the Pacific Island Jurisdictions.

REGISTRY STRUCTURE AND METHODS

NPCR cancer registries electronically transmit data to CDC annually, using a standardized record layout and coding system.

INTERPRETING THE RESULTS

The 2003–2007 data included in this report meet the following data quality criteria for all cancer sites combined: case ascertainment is at least 90% complete; no more than 5% of cases are ascertained solely on the basis of a death certificate; no more than 3% of cases are missing information on sex or age; no more than 5% of cases are missing information on race; and at least 97% of the registry's records passed a set of computerized edits.



USE OF THE DATA

CDC and the United States National Cancer Institute, in collaboration with the North American Association of Central Cancer Registries, annually publish the *United States Cancer Statistics* report. These federal cancer statistics are available to the public and cancer control planners through public-use and restricted-access datasets. Monographs, peer-reviewed publications, and special topic reports have also been published.

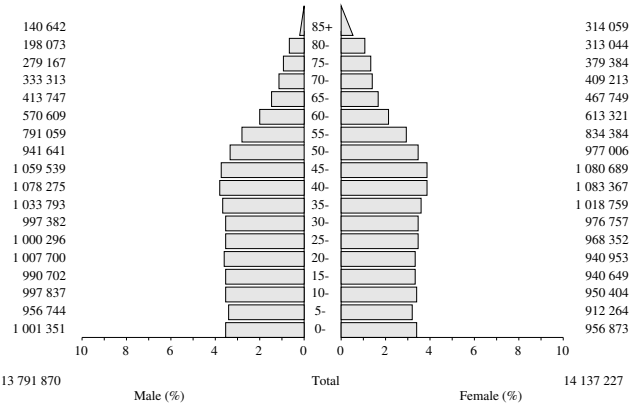
USA, SEER

REGISTRATION AREA

Participant registries in the Surveillance, Epidemiology, and End Results (SEER) Program were selected on the basis of their ability to operate and maintain a high-quality population-based cancer reporting system, and for their epidemiologically significant population subgroups. The SEER Program currently covers approximately 26% of the United States population. However, for consistency with earlier IARC publications, data were submitted from the original nine SEER areas: five states (Connecticut, Iowa, New Mexico, Utah, and Hawaii) and four metropolitan areas (the San Francisco Bay area, California; Detroit, Michigan; Atlanta, Georgia; and Seattle, Washington). These registries cover approximately 10% of the United States population, and are fairly comparable to the country's general population with regard to measures of poverty and education.

REGISTRY STRUCTURE AND METHODS

The SEER Program is a continuing project of the Surveillance Research Program of the United States National Cancer Institute (NCI). It was initiated in 1973 as an outgrowth of the End Results Program and the three National Cancer Surveys. The programme aims to determine the incidence of cancer in selected geographical areas in relation to certain demographic and social characteristics of the population, and to estimate annual incidence in the USA. Trends in incidence by site and histology are monitored, as are survival and trends in survival. Studies are conducted to identify possible etiological factors, which can identify groups within the population at high or low risk of cancer. Participant registries transmit data to NCI within 13 months after the end of each calendar year. In addition to all malignant and in situ neoplasms as defined by ICD-O (with the exception of non-melanoma skin cancers and cervical carcinoma in situ since 1996), the registries collect information about extent of disease and first course of therapy. Neither patient names nor the names of treating facilities are provided to NCI.



USE OF THE DATA

SEER data are updated annually and provided as a public service. The data are used by thousands of researchers, clinicians, public health officials, legislators, policy-makers, community groups, and the public. SEER publications and data are available from the SEER website (http://www.seer.cancer.gov/).

REGISTRATION AREA

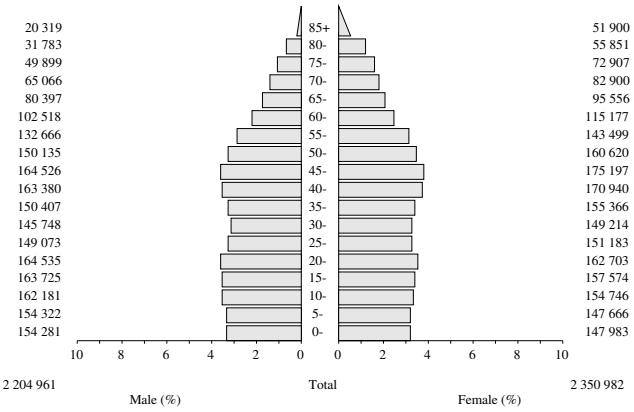
The Alabama Statewide Cancer Registry (ASCR) is a statewide population-based cancer registry that collects data on all cancer cases diagnosed or treated in the state of Alabama in the USA.

REGISTRY STRUCTURE AND METHODS

The ASCR was established in 1995 by the Alabama Department of Public Health in response to a state law (Act 95-275) that made cancer a reportable condition. Data collection began on 1 January 1996. The ASCR is located within the Bureau of Family Health Services and is responsible for maintaining a statewide cancer incidence reporting system for the purpose of providing accurate and up-to-date information about cancer in Alabama. The ASCR is a participant in the National Program of Cancer Registries (NPCR), which was established by the United States Centers for Disease Control and Prevention (CDC) in 1992 through the federal Cancer Registries Amendment Act (Public Law 102-515). The NPCR provides funding, guidance, and programme standards for state cancer registries throughout the USA. In recognition of the ASCR's achievement of NPCR standards for data completeness, timeliness, and quality, Alabama's cancer data are included in the *United States Cancer Statistics* report. The ASCR is a member of the North American Association of Central Cancer Registries (NAACCR), which sets standards for completeness, timeliness, and data quality. Registries that meet the highest standards receive NAACCR Gold Certification. The ASCR has achieved NAACCR Gold Certification since data year 2004.

INTERPRETING THE RESULTS

Alabama has breast cancer and cervical cancer screening programmes (with 3% coverage only) for women aged 40–64 years, which started in 1996.



USE OF THE DATA

The ASCR's central repository of information is a valuable tool for monitoring trends in cancer incidence, identifying populations at high risk of cancer, facilitating studies related to cancer prevention, and planning cancer control initiatives.

§Includes 4 cases of unknown age

USA, Alaska

REGISTRATION AREA

The Alaska Cancer Registry (ACR) covers the population of the state of Alaska – the northernmost state in the USA. Alaska makes up 16% of the total land area of the country, but accounts for only 0.2% of the country's population. At the most recent census (2010), the population of Alaska was 710 000. Most of the state is rural and sparsely populated. About 41% of Alaskan residents (292 000) live in the municipality of Anchorage, although Anchorage makes up only 0.3% of the state's land area. Alaska's population is 71.4% White, 17.0% Alaska Native or American Indian, 7.2% Asian or Pacific Islander, and 4.4% Black.

CANCER CARE FACILITIES

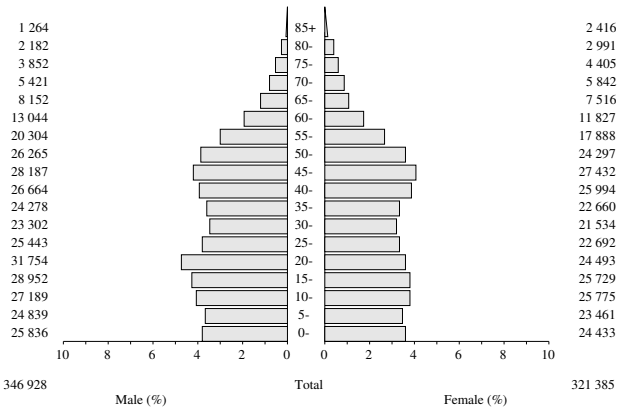
General health care in Alaska is provided by 24 hospitals, numerous health clinics, and many private practitioners. Because the municipality of Anchorage has the largest population, it also has the most health care facilities, including four hospitals. Alaska Natives are provided health care at no cost at a central hospital in Anchorage.

REGISTRY STRUCTURE AND METHODS

The ACR is located in Anchorage and is part of the state health department. It is funded mostly by the United States Centers for Disease Control and Prevention (CDC), through the National Program of Cancer Registries (NPCR), and partly by the state health department. The ACR is staffed by four full-time registrars (one of whom is also the registry manager) and a full-time data analyst. Cancer is a reportable disease by state law. The ACR's annual caseload is approximately 2700 consolidated malignancy cases. The ACR receives most of its cases from hospitals. The remaining cases are received from physicians, pathology laboratories, other state cancer registries, and death certificate review. Quality control is regularly performed on the data, through the use of the most current North American Association of Central Cancer Registries (NAACCR) edits metafile.

INTERPRETING THE RESULTS

The Alaska Breast and Cervical Health Check programme provides breast and cervical cancer screening services for women who have low income or whose insurance does not cover these services. In addition, the Alaska Native Tribal Health Consortium provides four breast and cervical cancer screening programmes and three colorectal cancer screening programmes.



USE OF THE DATA

The ACR prepares an annual report on cancer incidence and mortality, and data are submitted annually to NAACCR and CDC for use in national databases and reports. ACR data are regularly requested by the Alaska State Legislature, physicians, researchers, and the general public.

*See note following population pyramid

USA, Arizona

REGISTRATION AREA

The Arizona Cancer Registry (ACR) covers the population of the state of Arizona in the USA. In 2005, the state's population was 5.9 million. About 90% of Arizona residents live in urban areas. Within the USA, Arizona has the second highest state concentration of American Indians, who account for 5% of the state's population. Overall, 60% of residents are non-Hispanic White, 29% are Hispanic, and 11% are of other races.

CANCER CARE FACILITIES

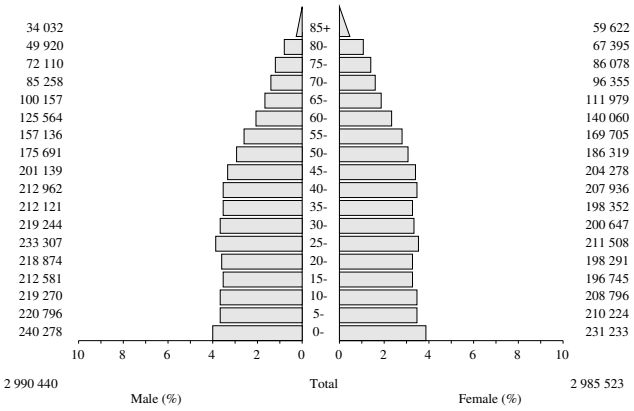
Health care in the region is provided by private practitioners, clinics, and hospitals. Health insurance is used by 81% of the population to pay for health care, and 74% of health insurance is nongovernmental.

REGISTRY STRUCTURE AND METHODS

The ACR is funded through state legislature appropriations to the Arizona Department of Health Services. Enhancement funds are provided through the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR). The registry has 6.75 full-time equivalent positions. The ACR is a population-based surveillance system that collects, manages, and analyses information on cancer incidence, survival, and mortality. Arizona law mandates the reporting of cancer cases by hospitals, clinics, physicians, and pathology laboratories. The registry conducts data linkage with death certificates to capture unreported cases, and has 21 data exchange agreements with other states. Quality control procedures include computerized and visual editing, case ascertainment reviews, and re-abstracting studies.

INTERPRETING THE RESULTS

The cancer rate in Arizona is stable, following national trends. Arizona's age-adjusted cancer incidence rates are generally lower than the national rates. The completeness of data coverage is 90–95%. Arizona has organized screening programmes for breast, cervical, and colorectal cancers. More than half of all men older than 40 years are screened for prostate cancer using the prostate-specific antigen (PSA) test.



USE OF THE DATA

The ACR analyses cancer incidence, mortality, and survival among Arizona residents yearly. Registry data are used for epidemiological research, cancer control planning, and addressing community cancer concerns. The registry is also involved in research studies that have been approved by the Arizona Department of Health Services' Human Subjects Review Committee.

USA, Arkansas

REGISTRATION AREA

The Arkansas Central Cancer Registry (ACCR) covers the state of Arkansas in the south-central USA. At the 2010 census, the population was 2.9 million.

CANCER CARE FACILITIES

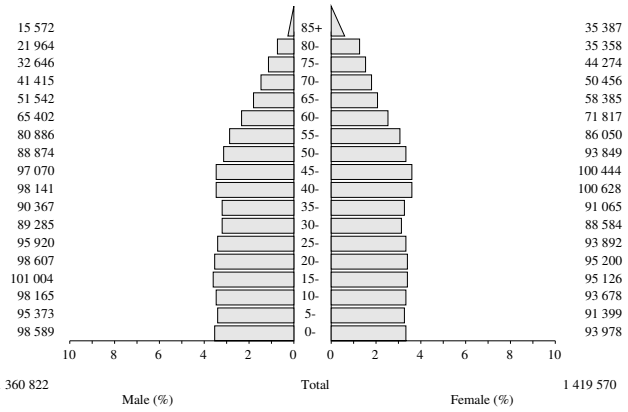
General health care is provided by 105 hospitals, including two Veterans Health Administration hospitals. Arkansas also has many surgery centres, clinics, and private physicians. There are 58 non-federal hospitals (31 with cancer registries) and three hospitals with cancer registries approved by the American College of Surgeons.

REGISTRY STRUCTURE AND METHODS

Cancer is a reportable disease in Arkansas, mandated by state law. The ACCR is located within the Arkansas Department of Health (ADH). The registry has 13 full-time positions that are federally funded (through the National Program of Central Cancer Registries) and two full-time positions that are funded by the state (through BreastCare – the Arkansas breast and cervical cancer screening programme). The ACCR uses information from hospitals throughout the state; cases from 27 of these are abstracted by ACCR staff members. The registry also uses information from pathology laboratories, surgery centres, private physicians, hospices, and nursing homes. The ACCR database (CancerCore DBMS v2) was created internally and is used for all registry computer activities. The ACCR receives death certificates and discharge summaries by electronic linkage with the Health Statistics Branch of the ADH.

INTERPRETING THE RESULTS

The ACCR provides data to Arkansas hospitals, treatment centres, and community organizations that offer screening programmes. The registry works with the Arkansas National Breast and Cervical Cancer Early Detection Program (NBCCEDP), which supports screening and diagnostic services for low-income, uninsured, and underserved women. The Colorectal Cancer Screening Program at the University of Arkansas for Medical Sciences (UAMS) is committed to the prevention, early detection, and treatment of colorectal cancer. It services minorities and individuals from underserved communities.



USE OF THE DATA

The ACCR database system includes many pre-defined reports and query tools for analysing cancer registry data. The ACCR has a contract with the Kentucky Cancer Registry for a web-based query system that provides public access to population-based cancer incidence data, which are updated annually.

§Includes 4 cases of unknown age

§Includes 1 case of unknown age

USA, California

REGISTRATION AREA

The California Cancer Registry (CCR) covers the state of California, with a population of more than 37 million, making it the most populous state in the USA. California is the third largest state, covering more than 155 000 square miles.

CANCER CARE FACILITIES

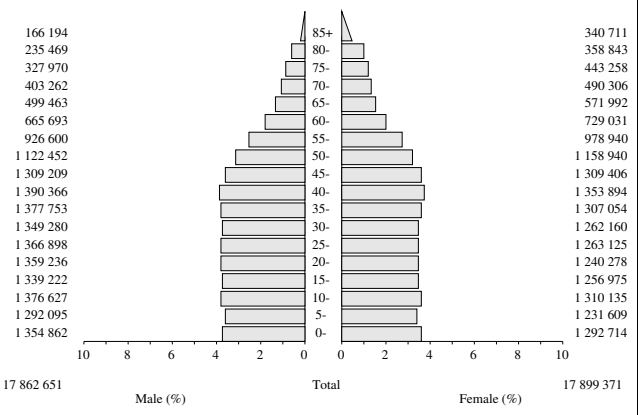
California has 380 inpatient facilities throughout the state that provide cancer care. Of these, 153 are approved by the American College of Surgeons, 218 are hospitals without a cancer registry, eight are Veterans Health Administration hospitals, and one is an Indian Health Service (IHS) hospital. California also has 308 independent surgery centres and 42 independent radiation therapy centres.

REGISTRY STRUCTURE AND METHODS

The CCR is a programme of the California Department of Public Health's Cancer Surveillance and Research Branch (CSRB), located in Sacramento, California. The CCR is a statewide population-based cancer surveillance system composed of regional registries, health care providers, registrars, and researchers. Provisions of the California Health and Safety Code mandated the establishment of a statewide system of cancer reporting. All hospitals and facilities in the state report cancer cases to the CCR electronically. Physicians who practise independently of a group also report cancer cases to the CCR – including surgeons who diagnose or treat cancer patients in their offices. The CCR also receives reports from pathology laboratories, outpatient surgery centres, and free-standing radiation facilities.

INTERPRETING THE RESULTS

The only organized screening programme in California during 2003–2007 was the Every Woman Counts/ National Breast and Cervical Cancer Early Detection Program.



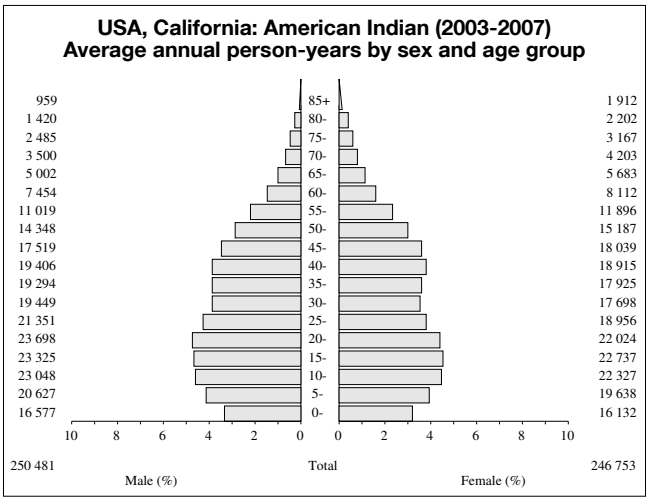
USE OF THE DATA

The CCR monitors the incidence and mortality of specific cancers over time and analyses differential cancer risks by geographical region, race/ethnicity, and other social characteristics. The CSRB analyses and disseminates information on cancer incidence and mortality. The system is also designed to monitor patient survival. The CCR produces an annual report on incidence and mortality, and collaborates with the American Cancer Society to produce *California Cancer Facts and Figures*. Reports are published online. The CSRB conducts and collaborates on special research projects concerning the etiology, treatment, and prevention of specific cancers. CCR data are provided to research institutions that seek to better understand the causes and control of cancer. The data are also used to address public concerns and questions. The CCR monitors the amount of cancer and cancer incidence trends by geographical area and time to detect potential problems of public health significance in occupational settings and the environment, and to assist in the investigation of such problems.

CONTRIBUTOR

Kurt Snipes

USA, California (2003-2007)
Average annual person-years by sex and age group



SOURCE OF POPULATION

Based on the 2000 national census carried out by the United States Census Bureau, including intercensal estimates and bridged single-race estimates derived from the original multiple-race categories.

§Includes 26 cases of unknown age

§Includes 17 cases of unknown age

USA, California, Los Angeles County

REGISTRATION AREA

The Cancer Surveillance Program (CSP) of Los Angeles County covers Los Angeles County, an urban area of more than 10 000 km^2. With a population of nearly 10 million, Los Angeles County is the most populous county in the USA. It is characterized by its population diversity (in terms of race/ethnicity, immigration, culture, religion, and socioeconomic status) as well as its geographical diversity.

CANCER CARE FACILITIES

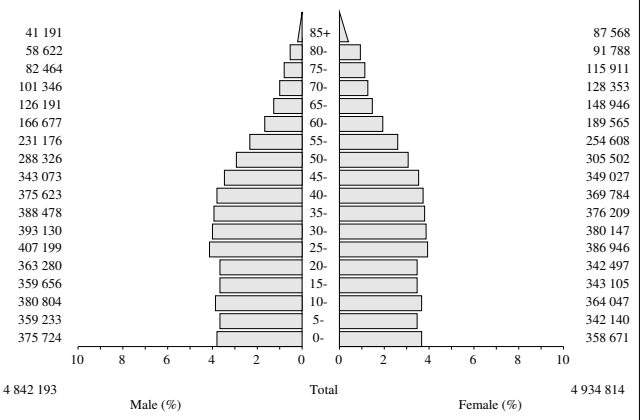
Los Angeles County has more than 100 hospitals and clinics, many of which provide advanced treatment and screening programmes.

REGISTRY STRUCTURE AND METHODS

The CSP of Los Angeles County was started at the University of Southern California, with complete population-based incidence coverage beginning in 1972. In 1987, the CSP became one of the 10 regional registries of the population-based California Cancer Registry. The CSP joined the National Cancer Institute's SEER Program in 1992. The registry uses active and passive surveillance. The active surveillance component consists of CSP personnel systematically screening pathology reports and other files at all hospitals and free-standing pathology laboratories (and some treatment facilities) to obtain pathology reports for all cancer patients diagnosed or treated. The passive surveillance component consists of each reporting facility completing a full abstract including stage and treatment information on every cancer patient diagnosed and/or treated at the facility. For each cancer patient, more than 200 data items (including disease or medical variables, demographics, and administrative descriptors) are coded and computerized. Before the CSP joined the SEER Program, record linkage with state of California death tapes was the only means of passive follow-up used by the registry. As a SEER registry, the CSP now collects follow-up data by record linkages with multiple sources and incorporates active follow-up information provided by hospitals.

INTERPRETING THE RESULTS

Screening programmes for breast, cervical, prostate, and colorectal cancers are widely available through health care systems and providers across Los Angeles County. Many government programmes and non-profit organizations offer free or low-cost cancer screening services for low- or no-income residents, the uninsured and underinsured, and those without a physician. However, the rates of screening access and use vary by socioeconomic level, race/ethnicity, health insurance availability, and cancer type. The overall screening rate has been increasing over time.



USE OF THE DATA

The CSP makes many scientific contributions towards understanding the demographic patterns and etiology of specific cancers.

REGISTRATION AREA

The Greater Bay Area Cancer Registry (GBACR) covers the populations of nine counties in the northern part of the state of California in the USA: Alameda, Contra Costa, Marin, Monterey, San Benito, San Francisco, San Mateo, Santa Clara, and Santa Cruz. The region is noteworthy for its racial/ethnic diversity, with substantial Hispanic and Asian populations. Most of the area's residents live in the urban San Francisco Bay Area, which includes a major financial centre as well as the technology centre nicknamed Silicon Valley.

CANCER CARE FACILITIES

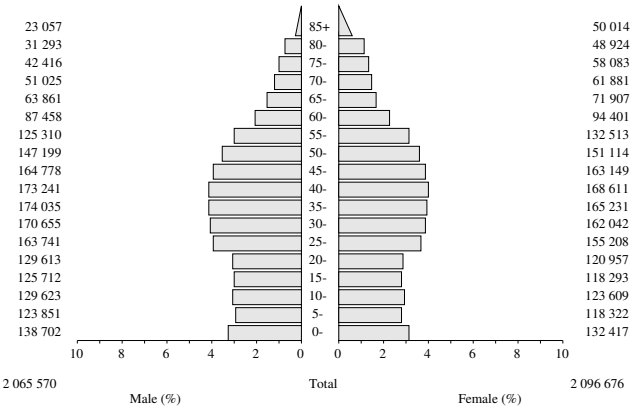
Cancer screening, diagnosis, and treatment are provided mostly through private insurance programmes by private hospitals and physicians, but there are also publicly funded services. Cancer patients in the region are served by more than 71 hospitals (including two large academic cancer centres), as well as more than 21 000 physicians and free-standing radiation, surgery, and pathology services. A significant proportion of residents receive managed health care through health maintenance organizations.

REGISTRY STRUCTURE AND METHODS

The GBACR has a staff of about 50 and is operated by the Cancer Prevention Institute of California. The GBACR has been part of the SEER Program since 1973, and data from Monterey, San Benito, Santa Clara, and Santa Cruz counties have been collected since 1988. The GBACR contains more than 900 000 incident cases and processes about 35 000 incident cases annually. Cancer has been a reportable disease by California state mandate since 1987. The law requires regional hospitals and private physicians to report all cancer diagnoses to a regional registry such as GBACR. A hospital-based computerized reporting system enables each hospital to electronically transmit registry-reportable information; 90% of all reports are received in this way. Quality assurance procedures implement SEER and North American Association of Central Cancer Registries (NAACCR) standards for visual and computerized editing, re-abstractions, and audits.

INTERPRETING THE RESULTS

Over the past decade, factors influencing cancer diagnosis and registration in the region have generally been stable. Efforts to improve reporting of physician-diagnosed cases, particularly melanomas, have increased. The Greater Bay Area has average to high rates of compliance with national cancer screening recommendations, particularly for mammography. Intense public attention has been paid to the high rates of breast cancer in the region.



USE OF THE DATA

GBACR data are used extensively to investigate trends in cancer occurrence and survival, particularly among ethnic minority groups. Investigators can also apply to access patient information to carry out more detailed epidemiological research studies.

§Includes 1 case of unknown age

*See note following population pyramid

USA, Colorado

REGISTRATION AREA

The Colorado Central Cancer Registry (CCCR) covers the population of the entire state of Colorado in the USA. The state is divided into 64 counties. At the 2010 census, the state's total population was 5 million, a 17% increase since 2000. Colorado's population is 81% White, 4% Black, 1% American Indian or Alaska Native, and 3% Asian. Approximately 21% of the population is Hispanic or Latino (of any race). The population is 86% urban.

CANCER CARE FACILITIES

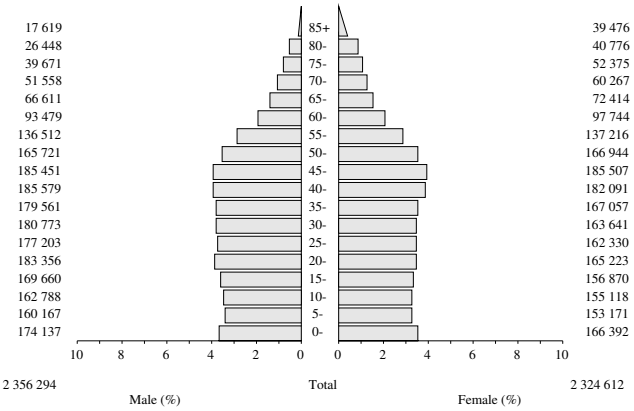
Cancer care in Colorado is mostly provided by the 75 inpatient facilities throughout the state; most are privately operated, two are public institutions, two are Veterans Health Administration facilities, and three are military facilities. Colorado also has many free-standing surgery and radiation therapy facilities, and private oncology practitioners also provide care in their offices.

REGISTRY STRUCTURE AND METHODS

The CCCR is located in the Colorado Department of Public Health and Environment, in the state capital of Denver. The registry is funded mostly by federal funds through the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR). Approximately 20% of the funding is from state general funds. The registry has 11.8 full-time equivalent positions and is staffed by a director, two statisticians, a data quality and training coordinator, a case ascertainment supervisor, and registrars (6.8 full-time equivalents). Most case reports are submitted by hospitals. Other data sources include pathology laboratories, radiation and surgery centres, death certificates, interstate data exchange, statewide hospital discharge datasets, and medical claims data. The CCCR maintains a rigorous quality control programme, which includes audits of hospital reporters, routine quality reviews of the data, and a statewide training programme for tumour registrars.

INTERPRETING THE RESULTS

Colorado has no special characteristics that influence incidence rates, apart from several screening programmes. Breast and cervical cancer screening programmes for women aged 50–64 years and 40–64 years, respectively, started in 1991. Colorectal cancer screening for men and women aged 50–64 years began in 2006.



USE OF THE DATA

The CCCR produces an annual report on cancer incidence and mortality. The report includes survival statistics and county-level data, as well as measures of early detection of disease. The data are published online and can be interactively queried. CCCR data are also used for many special studies, environmental risk analyses, cancer control programme evaluations, cancer care facility market analyses, and responses to citizen inquiries.

§Includes 3 cases of unknown age

USA, Connecticut

REGISTRATION AREA

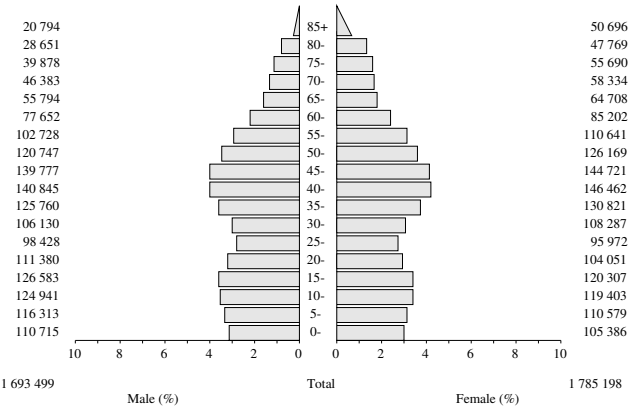
The Connecticut Tumor Registry (CTR) covers the entire state of Connecticut in the USA, which has an area of approximately 14 400 km^2 and a total population of about 3.6 million, making Connecticut the fourth most densely populated state in the country.

REGISTRY STRUCTURE AND METHODS

The CTR is the oldest population-based registry in the USA, containing records on all reported tumours diagnosed in Connecticut residents since 1935. The registry has attained national and international prominence in the study of cancer epidemiology, and has been a member of the SEER Program since 1973. Before 1973, the CTR was a participant in the End Results Program sponsored by the National Cancer Institute. The CTR has collected data on about 718 000 cancer cases diagnosed since 1973. Of these, approximately 248 000 cases are coded as "alive" and are under active follow-up (excluding in situ cervical cancers). Data on the more than 204 000 tumours diagnosed from 1935 to 1972 are part of the CTR's historical files from the pre-SEER era. Reporting of cancer cases to the CTR by all licensed medical providers is mandated by state statute. The CTR receives approximately 90% of its case reports from Connecticut hospitals and private laboratories. Other reports are received from independent ambulatory surgery, radiation, and infusion therapy centres. The CTR also has reciprocal reporting agreements with all contiguous states, as well as southern states recognized as typical winter holiday destinations for Connecticut residents (such as Florida).

INTERPRETING THE RESULTS

Cancer screening rates are relatively high in Connecticut compared with other states. In 2012, only about 20% of Connecticut women aged 18 years or more reported not having had a Pap test in the previous 3 years, and only 18.5% of women aged 50 years or more had not received a mammogram in the previous 2 years. In 2012, 74.5% of Connecticut adults reported that they had undergone sigmoidoscopy or colonoscopy at least once (at any time in the past), and 16.4% reported having had a faecal occult blood test in the previous 2 years.



USE OF THE DATA

CTR data are used by a wide variety of researchers for studies aimed at reducing cancer incidence and severity, improving the quality of cancer care, and investigating treatment cost containment. The data are also used for public health assessments that identify specific population groups within Connecticut in which screening and treatment improvements are most needed, and in the development of policy initiatives to reduce the burden of cancer throughout the state.

USA, Delaware

REGISTRATION AREA

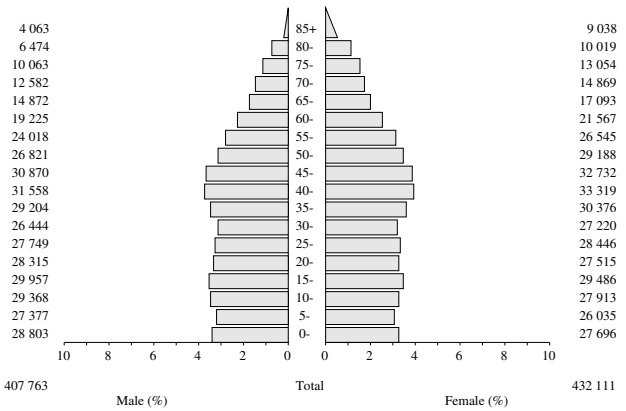
The Delaware Cancer Registry (DCR) ensures accurate, timely, and routine surveillance of cancer trends among residents of the state of Delaware in the USA. In 2006, the Delaware Population Consortium estimated the state's population at 855 000. At the time of this estimate, slightly more than 75% of the state's residents were White, 21% were Black, and 3% were of other races; 48.5% of residents were male and 51.5% female. Delaware's population is growing and becoming more diverse. It is also ageing: In 1990, about 12.1% of the state's residents were aged 65 years or older; by 2006, about 13.8% of residents were in that age range. This percentage is expected to continue to increase and was expected to exceed 18% by 2012. Delaware's Hispanic population, estimated by the United States Census Bureau in 2004 at slightly more than 48 000, is also growing, and this is an important ethnic group that the state makes a concerted effort to serve.

REGISTRY STRUCTURE AND METHODS

The DCR was founded in 1972 and legally established in 1980 under the Delaware Cancer Control Act (DCCA). The DCR is a state central cancer registry funded by the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR). The DCR is part of the Comprehensive Cancer Control Program within the Chronic Disease Prevention Bureau of the Delaware Division of Public Health's (DPH's) Health Promotion and Disease Prevention Section. The registry works collaboratively with DPH epidemiologists to report incidence and mortality statistics. The DCR has four full-time staff members: two state employees, a management analyst III (the registry manager), and a medical records technician. It also has two contractual employees from ICF International: a quality assurance coordinator/trainer and a project manager. The DCCA requires all providers diagnosing or treating cancer cases (including hospitals, physicians, pathology laboratories, and ambulatory surgery centres) to submit information on each case to the registry within 180 days. The entities currently reporting to the DCR include seven hospitals, 10 diagnostic laboratories, 14 free-standing ambulatory surgery centres, and 80 physicians.

INTERPRETING THE RESULTS

Breast and cervical cancer population screening programmes for women aged 40–64 years (with 100% coverage) began in 1997. Screening for colorectal and prostate cancers for individuals aged 50–64 years began in 2002.



USE OF THE DATA

The data collected are used for a variety of activities: monitoring trends in cancer incidence and mortality by site, geographical area, and demographic characteristics of the population; guiding planning and evaluation of cancer control programmes; assisting in prioritizing health resource allocation; advancing clinical, epidemiological, and health services research; and evaluating cancer cluster reports.

USA, Florida

REGISTRATION AREA

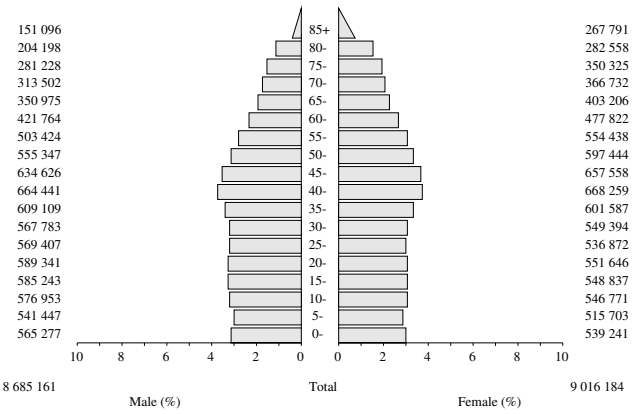
The Florida Cancer Data System (FCDS) covers the 18 million residents of the state of Florida in the USA. The state is divided into 67 counties. The population of Florida is approximately 80% White and 15% Black. About 20% of Florida's population is of Hispanic origin.

CANCER CARE FACILITIES

A total of 208 reporting hospitals, 250 free-standing ambulatory surgical and radiation treatment facilities, 600 pathology laboratories, and more than 700 physicians' offices contribute approximately 100 000 new incident cases to the FCDS each year.

REGISTRY STRUCTURE AND METHODS

The FCDS is the legislatively mandated population-based central cancer registry for the state of Florida. The registry is a joint project of the University of Miami Miller School of Medicine, the Florida Department of Health, and the United States Centers for Disease Control and Prevention (CDC). Data are collected and coded by the FCDS in accordance with the national standards put forth by the North American Association of Central Cancer Registries (NAACCR), and the FCDS has achieved NAACCR Gold Certification – the highest level available.



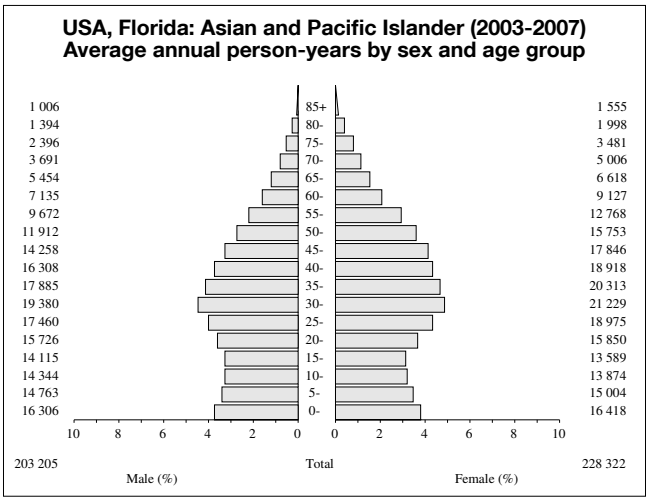
USE OF THE DATA

The FCDS provides quality data for surveillance and research purposes, and for cancer control and programme evaluation for several state and national organizations. FCDS data are used extensively throughout the Florida Department of Health for the formulation and evaluation of cancer control and prevention activities, and by the Florida Cancer Control and Research Advisory Council (C-CRAC), which is responsible for defining cancer priorities for the state of Florida. The FCDS also provides its data to state and national researchers and cancer prevention and control professionals.

CONTRIBUTOR

Jill MacKinnon

USA, Florida (2003-2007)
Average annual person-years by sex and age group



SOURCE OF POPULATION

Based on the 2000 national census carried out by the United States Census Bureau, including intercensal estimates and bridged single-race estimates derived from the original multiple-race categories.

REGISTRATION AREA

The Georgia Comprehensive Cancer Registry (GCCR) is a population-based registry covering the entire state of Georgia in the USA. In 2005, Georgia's population was estimated at 9.1 million. At the time of this estimate, 60% of residents were White, 30% were African-American, 3% were Asian, and the rest were of other races. Georgia's Hispanic population was estimated at 9%. Most Georgians (80%) live in urban areas.

CANCER CARE FACILITIES

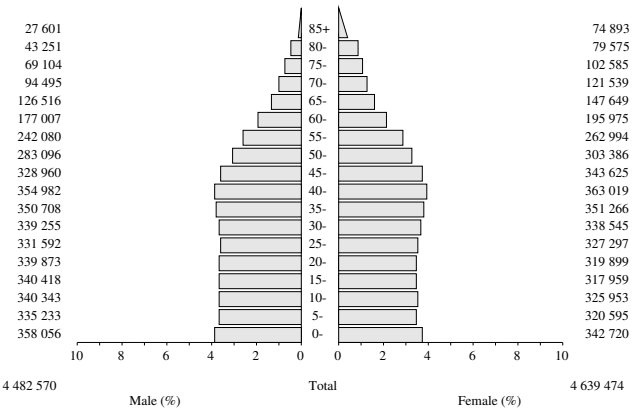
All 139 hospitals in Georgia report cancer data to the GCCR, as do most pathology laboratories, radiation facilities, and oncology treatment centres.

REGISTRY STRUCTURE AND METHODS

The GCCR is located within the Georgia Department of Public Health, in the state capital of Atlanta. The registry is funded by the state and the federal government. Since 1995, the GCCR has participated in the National Program of Cancer Registries (NPCR), established by the United States Centers for Disease Control and Prevention (CDC). The GCCR employs four cancer registrars, two epidemiologists, and a data manager for data collection and analysis. It contracts with the Georgia Center for Cancer Statistics (GCCS) for data management. Reporting facilities submit automated data to the GCCR on a monthly basis. Annually, the GCCR conducts data linkages with the Georgia Discharge Database System to identify missed cases. It also conducts linkages with both the state mortality file and the National Death Index, and conducts active follow-up. GCCR cancer coordinators conduct case-finding and re-abstracting audits on a sample of hospitals yearly. All health care facilities that provide diagnostic evaluations and/or treatment for cancer patients are required to report cancer cases within their patient populations to the GCCR. The registry also maintains reporting agreements with neighbouring states so that Georgia residents who are diagnosed or treated in out-of-state facilities can be identified.

INTERPRETING THE RESULTS

Cervical cancer screening (for women aged 21–64 years) started in 1960, and breast cancer screening (for women aged 40–64 years) started in 1993. Coverage is low, at about 15%.



USE OF THE DATA

The GCCR prepares cancer incidence and mortality reports highlighting trends and changes. It also prepares special reports on breast, cervical, colorectal, lung, prostate, and childhood cancers. Cancer incidence and mortality analyses are available from http://dph.georgia.gov/georgia-comprehensive-cancer-registry. Cancer data are analysed to meet the needs of the Georgia Comprehensive Cancer Control Program. The registry also provides researchers with cancer data, responds to data requests, and investigates cancer clusters.

REGISTRATION AREA

The Metropolitan Atlanta SEER Registry (MASR) records cancer cases diagnosed in residents of five contiguous counties (Clayton, Cobb, DeKalb, Fulton, and Gwinnett) surrounding Atlanta, the state capital of Georgia in the USA. In 2005, the covered population was estimated at 3.3 million. At the time of this estimate, 56% of residents were White, 38% were Black, and 6% were of other races. The combined population of these five counties accounted for 36% of the overall population of Georgia (which is divided into a total of 159 counties).

CANCER CARE FACILITIES

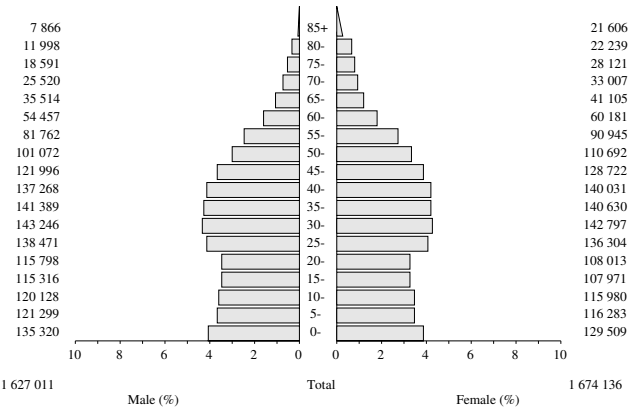
All hospitals, pathology laboratories, and radiation facilities in the registry coverage area report cancer data, as do most oncology treatment centres.

REGISTRY STRUCTURE AND METHODS

The MASR is funded by the National Cancer Institute (NCI) and operated by the Georgia Center for Cancer Statistics (GCCS), a division of the Rollins School of Public Health at Emory University. The registry staff includes epidemiologists, quality control editors, data abstractors, and analysts. Cancer is a reportable disease in the state, and the registry uses both active and passive case finding and reporting. Most facilities identify and electronically transmit their cases to the registry on a monthly basis. Registry staff members actively identify and collect cases from some radiation therapy facilities, large physician practices, and selected other facilities. Patient follow-up is also conducted using both active and passive methods. Case-finding and re-abstraction audits are regularly performed.

INTERPRETING THE RESULTS

The MASR actively shares data with the Georgia Comprehensive Cancer Registry (GCCR) and other states, to ensure complete case ascertainment and treatment information. The GCCS serves as the designated agent of the state of Georgia for conducting the day-to-day operations of the GCCR. For selected cancers that may be diagnosed and treated solely in physicians' offices, incidence records may be missing from the registry, due to a general lack of reporting by physicians. Cervical cancer screening (for women aged 21–64 years) started in 1960, and breast cancer screening (for women aged 40–64 years) started in 1993. Coverage is low, at about 15%.



USE OF THE DATA

The MASR submits data on an annual basis to the NCI's SEER Program. De-identified registry data are available from the SEER Program's website (http://www.seer.cancer.gov/), and cancer statistics are also available from the GCCS website (http://web1.sph.emory.edu/GCCS/cms/index.html). Research is a key part of the MASR's mission, and the registry both actively conducts research and cooperates with researchers across the USA.

USA, Idaho

REGISTRATION AREA

The Cancer Data Registry of Idaho (CDRI) covers the state of Idaho. In 2005, the population was estimated at 1.4 million. The majority of Idahoans are non-Hispanic Whites. Hispanics and Native Americans are the two largest minority groups, accounting for 11.5% and 1.7% of the state's population, respectively. Geographically, Idaho is a large state (covering 216 500 km^2). It is the seventh least densely populated state in the USA, with 7.4 inhabitants per km^2.

CANCER CARE FACILITIES

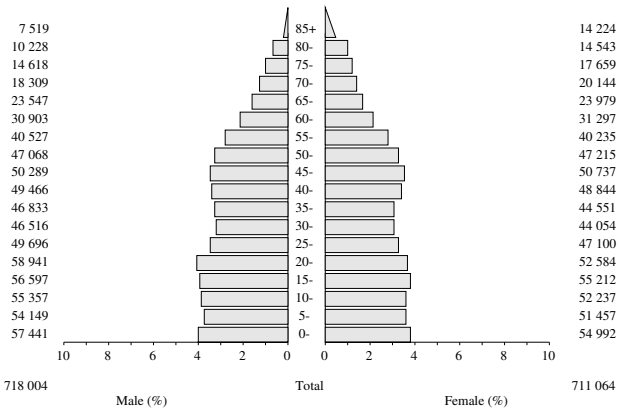
The rural character of Idaho and the severe winters in much of the state create difficulties in access to cancer care. Seven hospitals in Idaho have cancer programmes approved by the American College of Surgeons Commission on Cancer. Nine facilities offer radiotherapy.

REGISTRY STRUCTURE AND METHODS

The CDRI collects incidence and survival data on all cancer patients who reside in Idaho or are diagnosed and/or treated for cancer in Idaho. The CDRI is one of the oldest cancer registries in the USA; it has functioned since 1969 and has been population-based since 1971. Since 1994, the CDRI has enhanced its operations and increased its use of cancer registry data with National Program of Cancer Registries (NPCR) funding administered by the United States Centers for Disease Control and Prevention (CDC). The CDRI is staffed by two registrars certified by the United States National Cancer Registrars Association, an epidemiologist, and a database analyst.

INTERPRETING THE RESULTS

Idaho has among the lowest screening rates in the USA for cancers of the breast, cervix, and colon. The state operates a breast and cervical cancer screening and early detection programme funded through CDC's National Breast and Cervical Cancer Early Detection Program (NBCCEDP). Through this programme, uninsured women with low incomes are generally eligible for cervical cancer screening (for women aged 40–64 years) and breast cancer screening (for women aged 50–64 years). There are no other organized population screening programmes in Idaho; cancer screening is otherwise opportunistic, and the costs may not be fully covered by health insurance programmes.



USE OF THE DATA

CDRI data are used for many purposes, including surveillance of cancer incidence rates, programme planning and evaluation, quality assurance, central registry systems development, responses to requests for information, and public health practice. CDRI data are also used in approved epidemiological and translational studies. Published reports on cancer incidence and mortality are available from the CDRI website (https://www.idcancer.org/).

USA, Illinois

REGISTRATION AREA

The Illinois State Cancer Registry covers the population of the state of Illinois in the USA, which in 2010 was estimated at 12.8 million. At the time of this estimate, the population was 79% White, 15.3% Black, and 5.7% Asian or of other races; 15.9% of the population was Hispanic and 84.1% non-Hispanic. The state has both highly urban centres and rural areas.

CANCER CARE FACILITIES

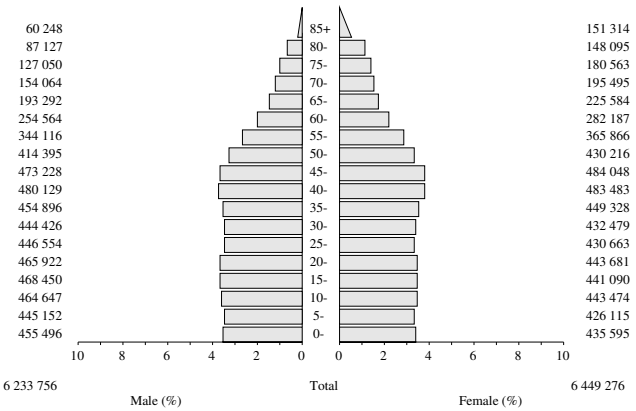
Illinois has 186 hospitals, 96 ambulatory surgical centres, 36 radiation treatment facilities, five Veterans Affairs facilities, and eight laboratories reporting cancer cases to the central registry. Physicians are also required to report any cancer cases diagnosed or treated in their offices.

REGISTRY STRUCTURE AND METHODS

The Illinois State Cancer Registry is housed in the Illinois Department of Public Health's Division of Epidemiologic Studies, within the Office of Policy, Planning and Statistics. It is the only source of population-based cancer incidence data for the state of Illinois. Incidence data are currently available for more than 1.4 million invasive cancer cases diagnosed among Illinois residents in 1986–2010. The Illinois State Cancer Registry has achieved North American Association of Central Cancer Registries (NAACCR) Gold Certification for 15 consecutive years.

INTERPRETING THE RESULTS

Differences in registry database completeness and data quality influence cancer incidence rates. Because the data for years before 1994 are less than 95% complete, some rates for those years, particularly the rates for all sites combined, underestimate the true rates for the Illinois population. Illinois has a breast and cervical cancer screening programme intended for women who could not otherwise afford those screenings. Most residents receive screening for cancers through their physician, with the majority of the cost covered by their insurance.



USE OF THE DATA

It is a core mission of the Illinois State Cancer Registry to promote high-quality research, to provide better information for cancer control, and to address public concerns and questions about cancer. The Illinois State Cancer Registry annually publishes a public-use dataset (along with state and county reports), responds to hundreds of requests for cancer information, and provides data for various research studies and cancer control programmes.

USA, Indiana

REGISTRATION AREA

The Indiana State Cancer Registry (ISCR) covers the entire population of Indiana, which ranks 15th in population size among the states of the USA, with nearly 6.5 million residents. The population is predominately White, urban, and middle-class. Indiana is divided into 92 counties, and a total of 62% of the state's residents live in the 18 counties that have more than 100 000 residents each; 48 counties have fewer than 35 000 residents each, and 11 counties have fewer than 15 000 residents each.

CANCER CARE FACILITIES

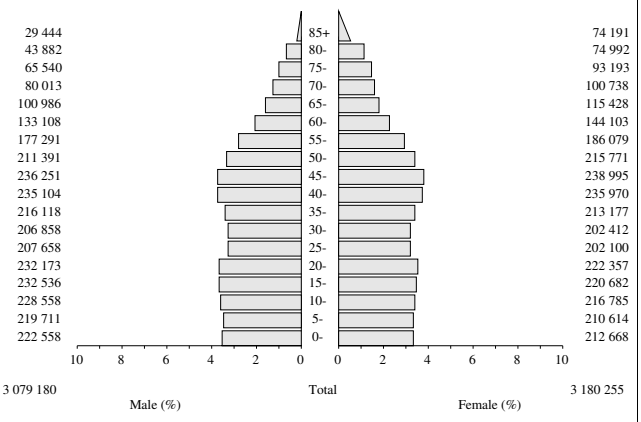
Currently, 15 non-hospital sources report to the ISCR electronically (by either FTP or eMaRC), and 36 report non-electronically. A total of 109 hospitals report cancer data to the registry.

REGISTRY STRUCTURE AND METHODS

The ISCR was established by state law (Public Law 174-1985) in 1985 and began to collect cases on 1 January 1987. As Indiana's central cancer registry, the ISCR carries the burden of cancer consolidation and record-keeping for the state. The Indiana Cancer Registry was established in 1985 by the statute Indiana Code 16-38-2, which became effective for all cases diagnosed in Indiana residents on 1 January 1987 or later. Rule 410 IAC 21 sets forth the standards for maintaining a state cancer registry pursuant to the original Public Law and Indiana Code in greater detail. The ISCR is supported by state and federal funds. The state of Indiana matches federal funding from the National Program of Cancer Registries (NPCR) with a 1:3 match, and contributes maintenance-of-effort funding. The ISCR is staffed by a director, two full-time certified tumour registrars (CTRs) – one of whom serves as the quality control manager – a software programmer, a cancer epidemiologist, an administrative assistant, an education trainer, and numerous contracted CTRs. The ISCR uses the database management software Rocky Mountain Cancer Data Systems (RMCDS).

INTERPRETING THE RESULTS

The Indiana Breast and Cervical Cancer Program (BCCP) targets women aged 40–64 years with a family income at or below 200% of the federal poverty level. Some hospitals hold screening events (for cancers of the breast, colorectum, etc.), and there are also individual clinics/organizations (such as the Susan G. Komen foundation) that hold events.



USE OF THE DATA

The ISCR has data exchange agreements in place with 18 other states, including the four states bordering Indiana. Data exchange with each state occurs at least annually. The ISCR also links annually with the BCCP to identify missing cases.

§Includes 1 case of unknown age

USA, Iowa

REGISTRATION AREA

The Iowa Registry covers the state of Iowa, which is located near the geographical middle of the USA, and is part of the country's so-called agricultural heartland. Iowa's climate is classified as humid continental, with an average annual temperature of 9.5 °C and average annual precipitation of approximately 80 cm. A total of 92% of the state's land area is devoted to agriculture, ranking highest in the USA.

CANCER CARE FACILITIES

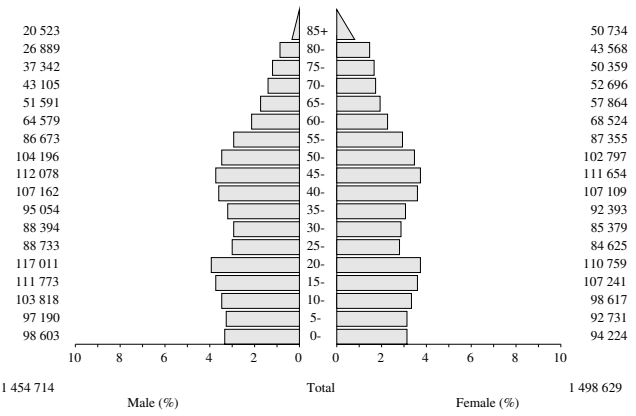
Cancer diagnostic and treatment services are widely available to the entire Iowa population, through both in-state and out-of-state facilities. These services include surgery, radiation therapy, chemotherapy, and other treatment modalities (such as immunotherapy).

REGISTRY STRUCTURE AND METHODS

Iowa cancer data collection began statewide in 1969 with the National Cancer Institute's (NCI's) Third National Cancer Survey, and resumed in 1973 as part of NCI's SEER Program. The Iowa Registry is located at the University of Iowa and works in collaboration with the Iowa Department of Public Health. Cancer became a reportable disease in Iowa in 1982. Cancer data for Iowa residents are obtained from 158 hospitals, clinics, and pathology laboratories located both within and bordering the state. Employees of the Iowa Registry also abstract data on laptop computers in specified geographical areas not covered by hospital cancer registrars. Quality control activities are carried out daily and constitute a significant portion of the central registry's operation. Cancer data are exchanged with 13 other states. The registry uses active and passive follow-up to obtain survival data. Passive follow-up activities include computerized linkage of data with death certificate information, driver's licence files from the Iowa Department of Transportation, and epidemiological vital status data from the United States Social Security Administration. Active patient follow-up is conducted periodically to track patients previously lost to follow-up. The registry successfully follows more than 98% of all patients into the current year.

INTERPRETING THE RESULTS

Although some Iowans who leave the state for cancer care are not identified, ascertainment is thought to be about 99%. Screening programmes are not monitored by the registry, but rather by the state through the Behavioral Risk Factor Surveillance System, in conjunction with the United States Centers for Disease Control and Prevention (CDC).



USE OF THE DATA

Policy-makers look to the registry to provide information about cancer burden and time trends in cancer incidence, stage of disease at diagnosis, survival, and mortality. Annual census counts for cancer rate calculations are based on data prepared by the United States Census Bureau.

USA, Kentucky

REGISTRATION AREA

The Kentucky Cancer Registry (KCR) is a population-based central cancer registry for the state of Kentucky in the USA. The population (4.4 million) is 78.1% White, 13.1% Black, and 8.8% American Indian, Alaska Native, Asian, and of other races.

CANCER CARE FACILITIES

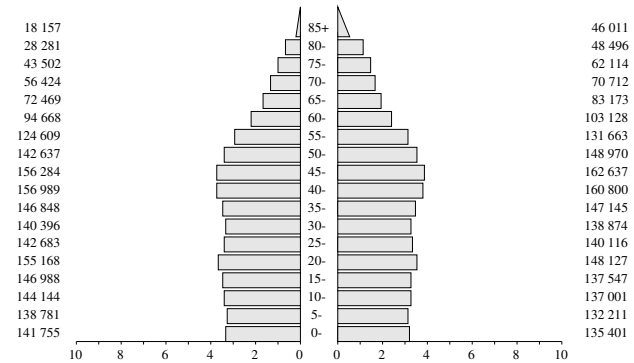
All health care facilities in Kentucky that diagnose or treat cancer are required to report all cancer cases to the KCR. These facilities include hospitals, free-standing treatment centres, non-hospital (private) pathology laboratories, and physicians' offices.

REGISTRY STRUCTURE AND METHODS

The KCR is the official population-based cancer registry for Kentucky. In 1991, the Kentucky General Assembly approved legislation requiring that all cancer cases be reported to the registry. The KCR is located at the University of Kentucky and receives funding from the state, the United States Centers for Disease Control and Prevention (CDC), the National Program of Cancer Registries (NPCR), and the National Cancer Institute's (NCI's) SEER Program. The state's larger hospitals (those treating more than 100 new primary cancer cases annually) are required to have their own tumour registrar(s). Regional coordinators employed by the KCR visit these facilities to provide additional training and case re-abstracting for quality control. The smaller hospitals (treating fewer than 100 new primary cancer cases annually) are assigned to one of four KCR regional abstractors, who record and report information on all cancer cases seen in these institutions.

INTERPRETING THE RESULTS

There has been no change in the area covered or the types of facilities reporting to the KCR. The registry follows the NCI/SEER reporting rules, and its data are believed to be complete and accurate. KCR data have been submitted to the North American Association of Central Cancer Registries (NAACCR) for evaluation of completeness and accuracy, and the registry has achieved NAACCR Gold Certification every year from 1997 to 2010. Screening programmes for breast, cervical, and colorectal cancer in Kentucky are provided through the local public health departments, and education efforts to encourage age-eligible individuals to have a screening test are conducted by the Kentucky Cancer Program. These efforts are guided by data from the KCR, which are combined with data from other population-based sources to create an index of the burden associated with the major types of cancer in 15 geographical regions of Kentucky.



USE OF THE DATA

KCR data are used to initiate cancer control programmes, evaluate intervention activities, and conduct epidemiological research.

USA, Louisiana

REGISTRATION AREA

The Louisiana Tumor Registry (LTR) covers the state of Louisiana, with a population of 4.4 million (63.9% White, 32.5% Black, 1.2% Asian, and 2.4% Latin American). About 25% of residents live in rural areas. One unique subpopulation in Louisiana is the Cajuns (descendants of French Canadians). Louisiana has a lower socioeconomic status than the USA average.

CANCER CARE FACILITIES

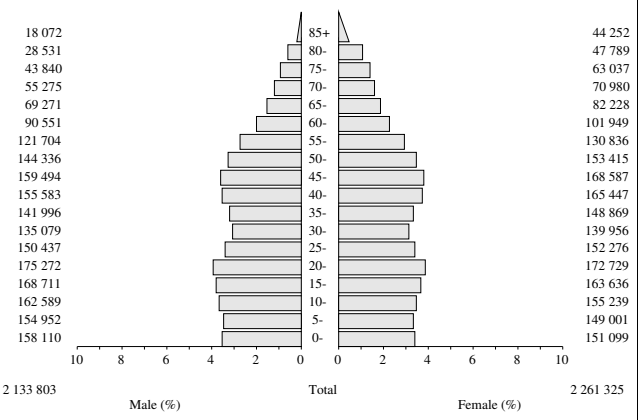
Approximately 125 hospitals provide cancer care, and most have accredited cancer programmes. The number of free-standing outpatient surgery facilities has been increasing. Louisiana offers free medical care to indigent residents through 10 public hospitals.

REGISTRY STRUCTURE AND METHODS

The LTR is based at Louisiana State University (LSU) and has eight regional offices. It is funded by LSU and through federal grants. The LTR has about 50 employees. Louisiana law mandates all licensed health care facilities and providers who diagnose and/or treat cancer to report all new cases to the LTR. It also requires data confidentiality and exempts providers from liability for reporting. About 70% of incident cases are submitted electronically and the rest are abstracted by LTR staff members. Non-hospital data sources include pathology laboratories and radiation and dermatology clinics. Quality control is routinely conducted. The LTR collects all SEER- and National Program of Cancer Registries (NPCR)-required items and follows SEER coding guidelines.

INTERPRETING THE RESULTS

Hurricanes Katrina and Rita hit southern Louisiana in 2005, resulting in major flooding, evacuation, and disruption of medical care. As a result, inaccurate population estimates and incomplete case capture may influence incidence rates. Louisiana has a breast and cervical health programme (http://lbchp.org/), and the Mary Bird Perkins Cancer Center (http://www.marybird.org/calendar-of-events) offers screening for colorectal, breast, prostate, skin, and oral cancers. The Feist-Weiller Cancer Center operates a mobile cancer screening unit that travels to 15 rural communities. Partners in Wellness cancer screening is free to financially qualified uninsured or underinsured individuals.



USE OF THE DATA

Incidence data are published annually in the *Cancer in Louisiana* series, available from the registry website (http://louisianatumorregistry.lsuhsc.edu/). The data are included in several databases for public use. Registry data are used for research, cancer control planning, and health services evaluation.

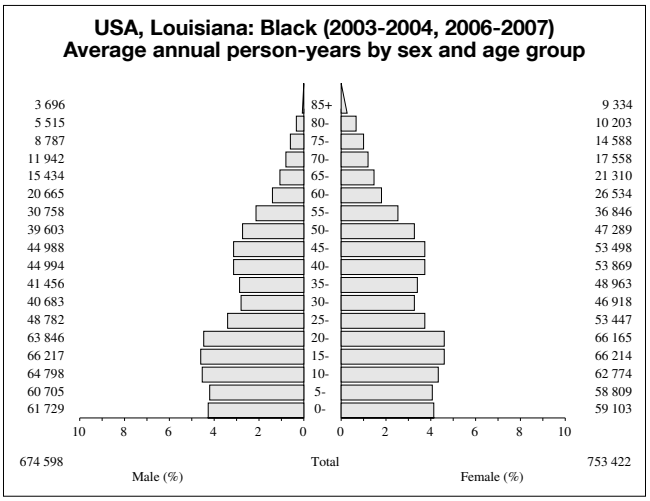
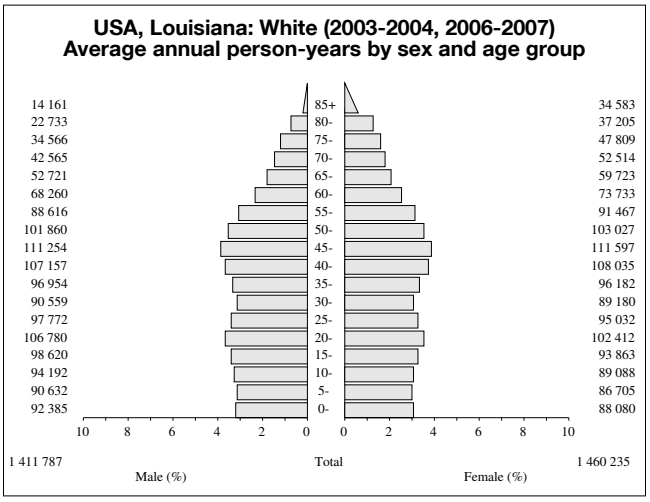
USA, Louisiana (2003-2004, 2006-2007)
Average annual person-years by sex and age group



SOURCE OF POPULATION

Based on the 2000 national census carried out by the United States Census Bureau, including intercensal estimates and bridged single-race estimates derived from the original multiple-race categories. The data take into consideration special processing procedures for southern Louisiana in the areas affected by Hurricanes Katrina and Rita.

10 MAJOR CANCERS, ASR (WORLD) PER 100 000



Male		Female	
Prostate	119.0	Breast	84.4
Trachea, bronchus and lung	68.7	Trachea, bronchus and lung	39.2
Colon	28.9	Colon	21.4
Bladder	20.6	Corpus uteri	12.0
Non-Hodgkin lymphoma	16.3	Non-Hodgkin lymphoma	11.1
Kidney	15.8	Thyroid	9.6
Rectum	13.2	Kidney	8.9
Melanoma of skin	11.2	Rectum	8.0
Pancreas	9.0	Ovary	7.9
Other and unspecified	8.4	Cervix uteri	7.4
All sites	408.8	All sites	282.5

NOTES ON THE DATA: *No official mortality data.

USA, LOUISIANA: BLACK
10 MAJOR CANCERS, ASR (WORLD) PER 100 000

Male		Female	
Prostate	165.2	Breast	88.0
Trachea, bronchus and lung	83.5	Trachea, bronchus and lung	35.5
Colon	35.9	Colon	26.9
Kidney	15.6	Corpus uteri	13.0
Rectum	13.8	Cervix uteri	10.2
Stomach	13.4	Rectum	9.3
Non-Hodgkin lymphoma	13.2	Pancreas	9.1
Bladder	12.6	Kidney	8.6
Liver	11.4	Non-Hodgkin lymphoma	8.3
Pancreas	11.4	Multiple myeloma	6.9
All sites	473.5	All sites	285.6

NOTES ON THE DATA: *No official mortality data.

USA, Louisiana, New Orleans

REGISTRATION AREA

The New Orleans Regional Tumor Registry covers New Orleans, the largest metropolitan area in the state of Louisiana. The population is 55% White, 41% Black, 4% Asian, and 9% Hispanic (of all races). The per capita income is slightly higher than the state average. In 2005, the population was 99% urban.

CANCER CARE FACILITIES

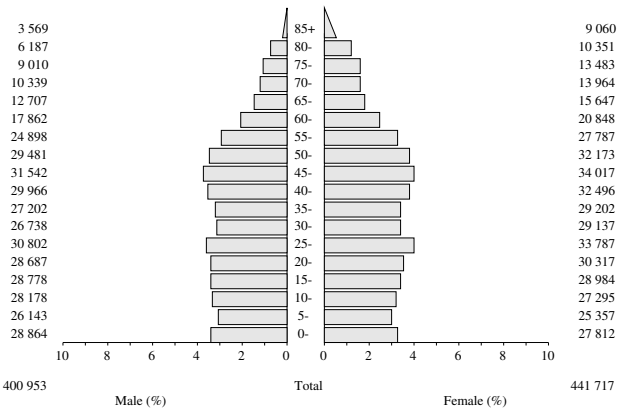
Cancer care is provided by 12 hospitals; almost all have accredited cancer programmes. The state's largest public hospital is in New Orleans and provides free care to indigent residents.

REGISTRY STRUCTURE AND METHODS

The registry is based at Louisiana State University (LSU), along with the central office of the Louisiana Tumor Registry (LTR). The New Orleans Regional Tumor Registry has 15 employees. It is funded by LSU and through federal grants. Louisiana law mandates all licensed health care facilities and providers who diagnose and/or treat cancer to report all new cases to the LTR. It also requires data confidentiality and exempts providers from liability for reporting. About 99% of incident cases are submitted electronically and the rest are abstracted by regional staff members. The LTR exchanges cases with 19 other states under case-sharing agreements, so missed cases are minimal. Quality control is routinely conducted. The LTR collects all SEER- and National Program of Cancer Registries (NPCR)-required items and follows SEER coding guidelines.

INTERPRETING THE RESULTS

Hurricane Katrina hit New Orleans in 2005, resulting in major flooding, evacuation, disruption of medical care, and destruction of records. As a result, inaccurate population estimates and incomplete case capture may influence incidence rates. Louisiana has a breast and cervical health programme (http://lbchp.org/), and the Mary Bird Perkins Cancer Center (http://www.marybird.org/calendar-of-events) offers screening for colorectal, breast, prostate, skin, and oral cancers. The Feist-Weiller Cancer Center operates a mobile cancer screening unit that travels to 15 rural communities. Partners in Wellness cancer screening is free to financially qualified uninsured or underinsured individuals.



USE OF THE DATA

Incidence data are published annually in the *Cancer in Louisiana* series, available from the LTR website (http://louisianatumorregistry.lsuhsc.edu/). The data are included in several databases for public use. Registry data are used for research, cancer control planning, and health services evaluation.

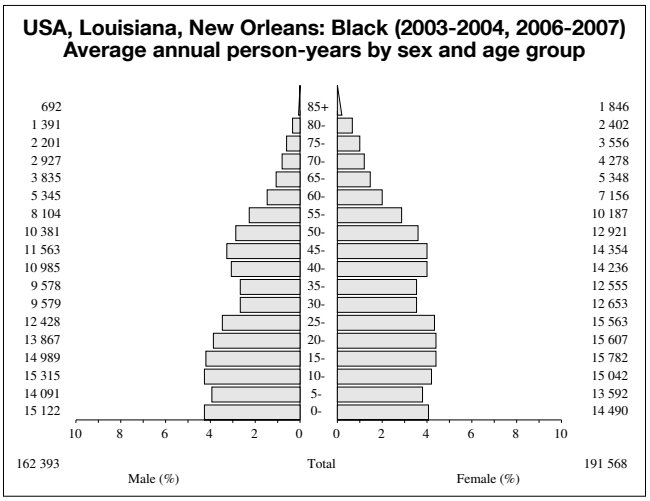
Average annual person-years by sex and age group

SOURCE OF POPULATION



Based on the 2000 national census carried out by the United States Census Bureau, including intercensal estimates and bridged single-race estimates derived from the original multiple-race categories. The data take into consideration special processing procedures for southern Louisiana in the areas affected by Hurricanes Katrina and Rita.

NOTES ON THE DATA

*No official mortality data.

USA, Maine

REGISTRATION AREA

The Maine Cancer Registry (CR) covers the state of Maine in the USA. The state has a large geographical area but a relatively small population. Maine is primarily rural, with a long Atlantic coast. The population is 97% White/Caucasian, with a small but important population of Native Americans, and small (but growing) Black, Hispanic, and Asian populations. French Canadian ancestry is widely distributed. The population has been stable numerically, but is ageing. In terms of the average age of its residents, Maine has become one of the oldest states in the USA. There are geographical and other disparities in access to health care within the state. Some of the smaller, rural access hospitals are closing.

CANCER CARE FACILITIES

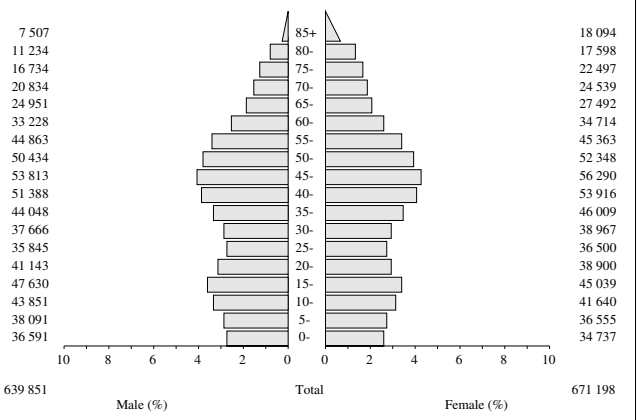
Many surgical specialists are underrepresented in the northern half of Maine, including gynaecological oncologists and plastic surgeons (for reconstruction), as are gastroenterologists and physicians in general, with many underserved areas.

REGISTRY STRUCTURE AND METHODS

Cancer reporting is mandated by state law for 37 Maine hospitals and for some physicians. The Maine CR is funded by the United States Centers for Disease Control and Prevention (CDC) (75%) and by the state (25%). The registry staff is small: there are typically 5.5 full-time equivalent positions with two vacancies. The staff includes one medical director/programme manager, certified tumour registrars (CTRs) (2.5 full-time equivalents), one financial manager, and one secretary. The registry also contracts an epidemiologist (0.4 full-time equivalents) and additional part-time CTRs. Technical support is inadequate. Quality control studies are currently limited. For several years before 2011, the registry carried out annual staging and treatment studies to determine whether all regions received standard care.

INTERPRETING THE RESULTS

In addition to the Maine CDC Breast and Cervical Health Program, federal funding enabled the start of a colorectal cancer screening programme in 2009 for underinsured and uninsured low-income residents aged 50–64 years. Maine has lost much of its manufacturing industry but still has an active shipbuilding sector. Arsenic (in well water) and radon are some of the known environmental exposures that may be elevated in Maine due to its geography.



USE OF THE DATA

The Maine CR reports incidence, stage of disease, and mortality on an annual basis, by county, etc. The registry encourages data use by researchers throughout the state, region, and nation, particularly when there is an opportunity to better understand high cancer incidence rates (overall and for specific sites) in Maine.

USA, Massachusetts

REGISTRATION AREA

The Massachusetts Cancer Registry (MCR) covers the population of the state of the Commonwealth of Massachusetts in the USA. At the 2011 census, the population was estimated at 6.5 million. The population is 76.4% non-Hispanic White, 7.6% non-Hispanic Black, 9.9% Hispanic, 5.6% non-Hispanic Asian, and 0.5% non-Hispanic Native American.

CANCER CARE FACILITIES

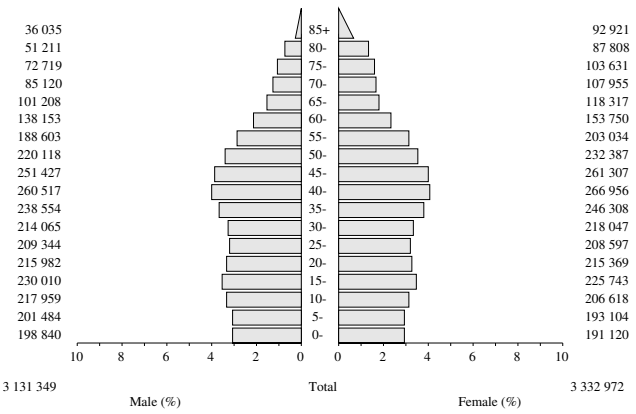
In 2012, a total of 65 acute care hospitals, six radiation centres, three endoscopy centres, four surgical centres, 19 independent laboratories, two medical practice associations, four radiation/oncology centres, and approximately 500 private-practice physicians in Massachusetts reported to the MCR.

REGISTRY STRUCTURE AND METHODS

The MCR is located within the Bureau of Health Information, Statistics, Research and Evaluation (BHISRE) at the Massachusetts Department of Public Health (MDPH). It is funded by the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR) (75%) and the Commonwealth of Massachusetts (25%). The registry staff includes a director, six operations staff members (quality assurance and data acquisition), two epidemiology staff members, two geographical information systems/special project staff members, and two systems analysts. The MCR follows CDC/NPCR programme requirements for data collection and reporting and has achieved North American Association of Central Cancer Registries (NAACCR) Gold Certification for completeness, quality, and timeliness for the past several years.

INTERPRETING THE RESULTS

The MCR has been collecting reports on melanoma cases from dermatologists and dermatology laboratories since 2001, and reports from urologists' offices since 2012. Data are collected on in situ and invasive cancers (including bladder cancers) and benign tumours of the brain and associated tissues, but not on basal or squamous cell skin cancers. There are organized screening programmes at the state level for breast, cervical, and colorectal cancers.



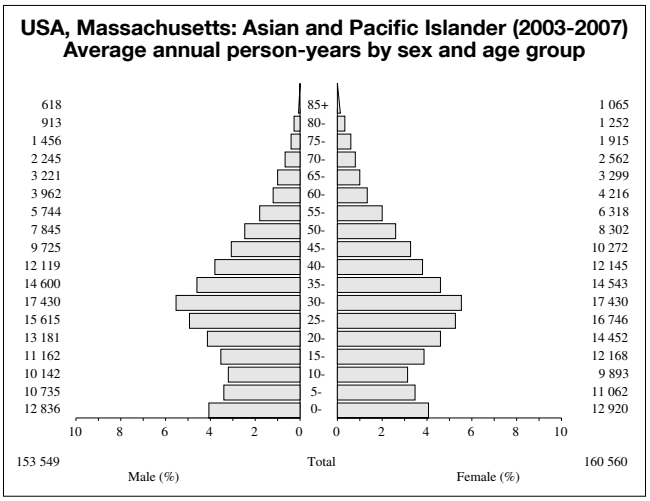
USE OF THE DATA

The MCR produces two annual reports: *Cancer Incidence and Mortality in Massachusetts* (which provides information on cancer incidence and mortality for the state as a whole) and *Cancer Incidence in Massachusetts: City and Town Supplement* (which provides information on cancer incidence for the state's 351 cities and towns). The registry also produces several special topic reports. MCR data are available to the public online from the MassCHIP website (http://www.mass.gov/eohhs/researcher/community-health/masschip/). The registry's data are also used for programme planning and evaluation, and by external researchers for epidemiological studies.

CONTRIBUTOR

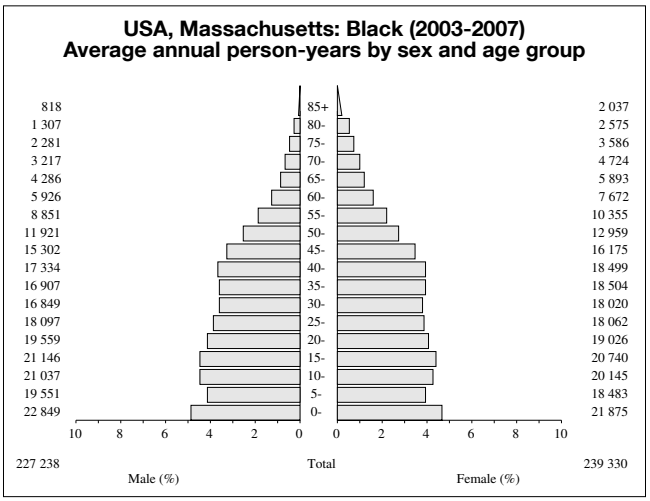
Susan Gershman

USA, Massachusetts (2003-2007)
Average annual person-years by sex and age group



SOURCE OF POPULATION

Based on the 2000 national census carried out by the United States Census Bureau, including intercensal estimates and bridged single-race estimates derived from the original multiple-race categories.



10 MAJOR CANCERS, ASR (WORLD) PER 100 000

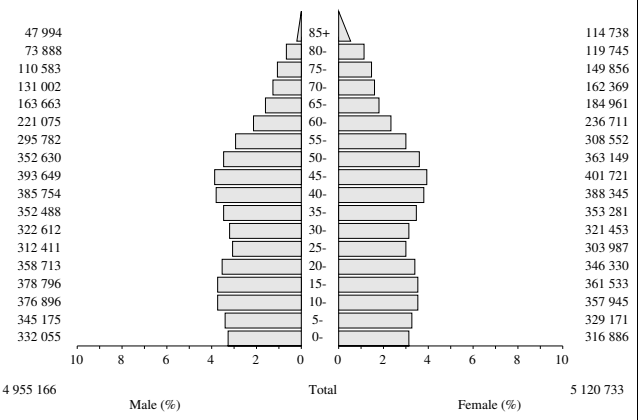
USA, Michigan

REGISTRATION AREA
The Michigan Cancer Surveillance Program covers the population of the state of Michigan in the USA. The state's population is approximately 78% White, 13% Black, 3% Asian, and 1% Native American. About 5% of the population is Hispanic.

CANCER CARE FACILITIES
Diagnostic and treatment services for cancer are widely available throughout Michigan. Radiotherapy services are widespread and generally readily available in population centres, with some access issues in rural areas.



REGISTRY STRUCTURE AND METHODS
The registry is located within the Michigan Department of Community Health and has 11 full-time equivalent positions. The registry is funded in part by the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR). Data collection is passive, with routine auditing of reporting by health facilities using certified tumour registrars (CTRs). About 85% of all case reports are submitted electronically. Most reports are received from hospitals and regional cancer registries, with additional reporting by pathology laboratories, clinics, physicians, and dentists. Resident case exchange agreements are in place with 21 other states. The registry is located within the Michigan Vital Records Office, providing ready access to death information. Reporting is required by law. Case information is confidential and protected by law. Improper use or release of the information is a crime. Registry quality, completeness, and timeliness are monitored through ongoing auditing of reporting facilities, with independent assessments of quality conducted annually by the North American Association of Central Cancer Registries (NAACCR) and periodic review conducted on behalf of CDC. The registry has achieved NAACCR Gold Certification since 1999.

INTERPRETING THE RESULTS
Breast and cervical cancer screening programmes for uninsured residents are in place throughout the state. Screening prevalence for breast and cervical cancers is reasonably high by United States standards, and prostate-specific antigen (PSA) testing is common in the population.

USE OF THE DATA
Registry data are used for reporting incidence, extent of disease, and survival. Data are also used in research and for the planning and evaluation of health services.

§Includes 5 cases of unknown age

§Includes 3 cases of unknown age

USA, Michigan, Detroit

REGISTRATION AREA

The area covered by the Metropolitan Detroit Cancer Surveillance System (MDCSS) is 5094 km^2, on the eastern border of Michigan, facing Canada. At the 2010 census, the covered population was 3.9 million, of whom 67.3% were White, 25.2% Black, 3.6% Asian, and 3.9% of other races; 4.0% were of Spanish origin. The area is predominantly urban and heavily industrialized, as the centre of the United States automobile manufacturing industry.

CANCER CARE FACILITIES

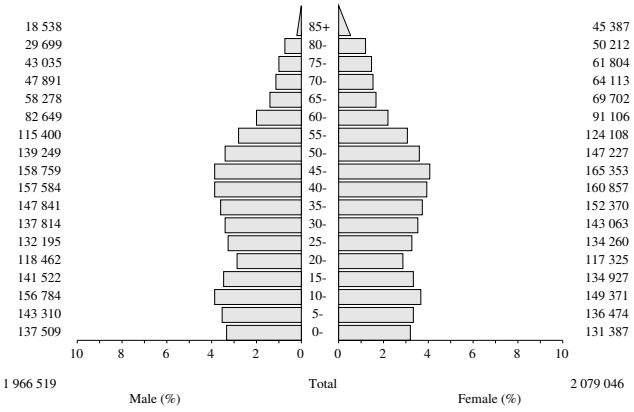
There are two National Cancer Institute (NCI)-designated Comprehensive Cancer Centers in the area, one within the borders of the MDCSS data collection area. Many of the more than 60 hospitals and other facilities in the area provide cancer care and have cancer research and treatment programmes.

REGISTRY STRUCTURE AND METHODS

The MDCSS is part of the Epidemiology Section housed in the Population Studies and Disparities Research Program at the Karmanos Cancer Institute and the Department of Oncology at the Wayne State University (WSU) School of Medicine. The registry began in 1949 as a pathology registry for 25 collaborating hospitals. In 1973, it became a founding participant in NCI's SEER Program. Cancer is a reportable disease in Michigan. The MDCSS is the official designate of the Michigan Department of Community Health (MDCH) for cancer data collection in the Detroit metropolitan area. The MDCSS provides incidence, first course of therapy, and survival reporting. Data are collected by MDCSS abstracting staff members from more than 60 hospitals, private pathology laboratories, radiation therapy facilities, and selected clinics and physicians' offices. Active follow-up is maintained for all cases, with requests for information sent to physicians biannually. Hospital re-admissions are abstracted, and Internet search engines are also used as part of active follow-up. Death certificates for the state of Michigan are linked quarterly to update vital status and cause of death.

INTERPRETING THE RESULTS

The state of Michigan conducts various cancer control and screening programmes in the area, including the Breast and Cervical Cancer Control Program (BCCCP) and the Michigan Colorectal Cancer Early Detection Program.



USE OF THE DATA

MDCSS data are used extensively in research conducted by WSU faculty members, who report to the MDCSS director. MDCSS researchers collaborate with other researchers. Registry data are also frequently used by local hospitals, health departments, and the MDCH for planning, evaluation, and education purposes. The data are also used to address community concerns about cancer risk.

§Includes 3 cases of unknown age

*See note following population pyramid

USA, Mississippi

REGISTRATION AREA

The Mississippi Cancer Registry (MCR) is a population-based registry that has served the citizens of the state of Mississippi in the USA since 1996. Mississippi's population is largely rural, and is 60% White, 37% Black, and 3% of other races; 19% of the population is uninsured.

CANCER CARE FACILITIES

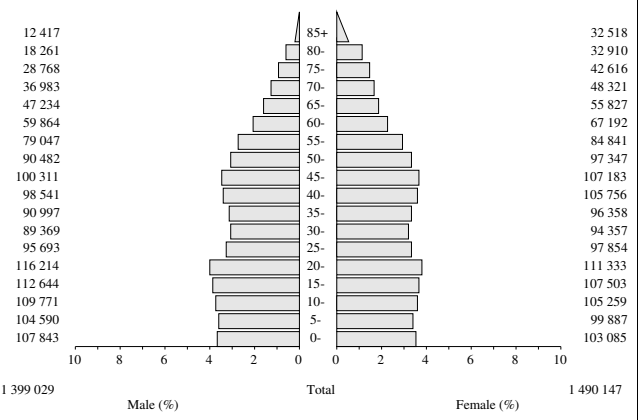
Out of nearly 100 hospitals in the state, only 13 have cancer programmes approved by the American College of Surgeons Commission on Cancer.

REGISTRY STRUCTURE AND METHODS

Reporting to the MCR is mandated by state law. The United States Centers for Disease Control and Prevention (CDC), the Mississippi State Department of Health, and the University of Mississippi Medical Center provide the funding for the registry. The MCR has 10 staff members, eight of whom are certified tumour registrars (CTRs). Hospitals and some clinics actively submit cancer cases to the MCR. Other cases diagnosed and treated in non-hospital settings are identified through pathology reports, and requests are made to the facility for the relevant cancer information. Reportable diseases are those required by CDC, and the standards for data collection are outlined by the North American Association of Central Cancer Registries (NAACCR). All data are subject to visual review and editing by registry CTRs, as well as edit checks using CDC- and NAACCR-required edit sets. SEER multiple primary rules are used to determine the number of primary cancers for an individual cancer patient. Active follow-up of patients is not performed. Passive follow-up is accomplished through linkage with Mississippi Vital Records and the National Death Index.

INTERPRETING THE RESULTS

The only organized screening programme directed towards the uninsured population is the Mississippi Breast and Cervical Cancer Early Detection Program, which screens only a small percentage of eligible uninsured women across the state.



USE OF THE DATA

The MCR publishes aggregate incidence and mortality statistics and stage of disease at diagnosis statistics online (http://www.umc.edu/mcr/) and provides data to the Mississippi State Department of Health for planning and evaluation of health services. MCR data are used in the planning, implementation, and evaluation of the Mississippi Comprehensive Cancer Control Plan. Data are also provided to researchers upon request.

§Includes 2 cases of unknown age

USA, Missouri

REGISTRATION AREA

The Missouri Cancer Registry (MCR) covers the state of Missouri in the USA, which has slightly more than 6 million residents and is divided into 115 counties. About 75% of Missouri residents live in a major or minor metropolitan area. The population is 84% White, 12% Black, and 4% of other races. Less than 4% of residents are Hispanic.

CANCER CARE FACILITIES

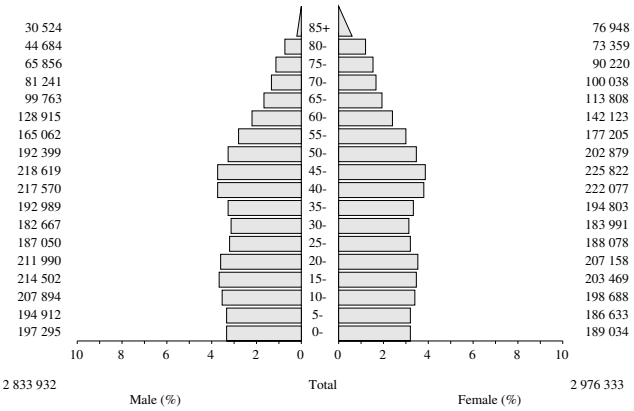
The MCR collects reports of newly diagnosed cancer cases from hospitals, long-term care facilities, ambulatory surgery centres, free-standing cancer treatment centres, pathology laboratories, dermatologists, and Missouri Vital Statistics, as well as through case-sharing agreements with 19 other states. By 2014, physicians' offices will submit data from electronic health records.

REGISTRY STRUCTURE AND METHODS

The MCR is a joint endeavour of the University of Missouri and the Missouri Department of Health and Senior Services, and receives funding from the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR). The registry staff includes a director, eight certified tumour registrars, two database administrators, a software support analyst, a statistician, an electronic communication coordinator, a special project coordinator, a part-time clerical support person, and two graduate research assistants.

INTERPRETING THE RESULTS

MCR data meet NPCR data quality and completeness standards. The MCR has achieved North American Association of Central Cancer Registries (NAACCR) Gold Certification. Collaboration with Missouri's breast and cervical cancer screening programme (Show Me Healthy Women) provides an additional case-finding source for MCR and increases the completeness of screening programme records. Missouri has a breast and cervical cancer screening programme but not a colorectal cancer screening programme.



USE OF THE DATA

MCR data are used for programme planning and evaluation, epidemiological studies, excess cancer inquiries, annual reports, and other purposes (e.g. to address and assess cancer prevention and control issues). Policy-makers look to the registry to provide information about cancer burden, time trends in cancer incidence, disparity reduction, etc. Missouri incidence data are available online (http://health.mo.gov/data/mica/MICA/) by site, race, age group, and geographical unit. Lists of the top 10 cancer sites by county for males, females, and the total population are available from http://mcr.umh.edu/mcr-county-level-data.php. County-level data are also available in single or double map displays combined with tables, time-series charts, bar charts, and scatter plots (http://mcr.umh.edu/mcr-instantatlas-data.php). The Missouri Cancer Registry and Research Center (MCR-ARC) maintains a website (http://mcr.umh.edu) to assist entities required by Missouri Statutes (192.650 - 192.657 RSMo) to report cases to the MCR.

REGISTRATION AREA

The Montana Central Tumor Registry (MCTR) covers the state of Montana, which had a population of 989 000 in 2010 (ranking 44th largest in the USA). Montana is a rural state; all but one of its 56 counties are considered rural or frontier as defined by their 2000 census population densities. Montana's population is 92% White. American Indians make up 8% of the population, and all other races account for less than 1%. Montana's ageing population is not evenly distributed; part of the state is heavily populated and other areas are very sparsely populated.

CANCER CARE FACILITIES

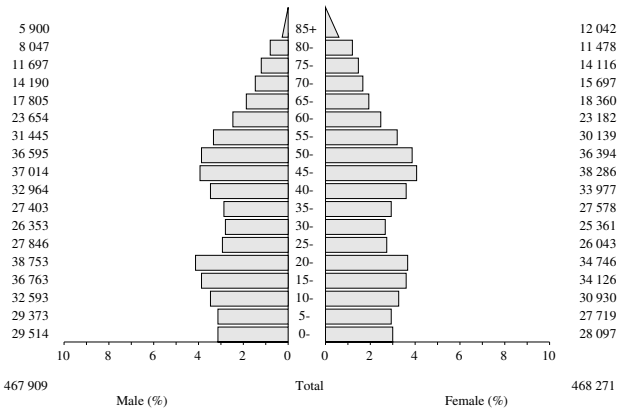
Cancer care is provided by about 52 hospitals and seven cancer centres approved by the American College of Surgeons Commission on Cancer.

REGISTRY STRUCTURE AND METHODS

The MCTR was mandated by law in 1979 and has been in operation since. Federal funding for registry enhancement was initially granted in 1995 through the National Program of Cancer Registries (NPCR). The registry is funded with NPCR funds (80%) and state funds (20%). Reportable cases are collected from hospitals, independent pathology laboratories, physicians, clinics, cancer treatment centres, out-of-state registries, and death certificates. Apart from the state hospitals, there are four independent pathology laboratories and 32 out-of-state cancer registries that report incident cancer cases. About 5200 new cancer cases are diagnosed among Montana residents per year. Since 2000, reporting has been nearly 100% complete. Most paediatric cases are treated out of state. The MCTR performs active lifetime follow-up and performs death linkage with the state's Office of Vital Statistics and the National Death Index.

INTERPRETING THE RESULTS

The Montana Cancer Screening Program supports comprehensive cancer control in the state by providing ongoing screening services and education to Montana men and women in a manner that is appropriate, accessible, cost-effective, and sensitive to the clients' needs. Screening services include mammograms, clinical breast exams, Pap tests, and pelvic exams for the early detection of breast and cervical cancers, and colonoscopies and faecal occult blood tests (FOBTs) for the early detection of colorectal cancer. Diagnostic testing is also provided for follow-up of abnormal screening tests.



USE OF THE DATA

As part of the registry's Coordinated Chronic Disease Prevention and Health Promotion effort, the MCTR's epidemiologist works closely with other chronic disease programmes to increase the collaborative use of surveillance data to better describe the burden of chronic disease in Montana. These collaborations include cross-programme data analysis and programme evaluation projects.

USA, Nebraska

REGISTRATION AREA

The Nebraska Cancer Registry (NCR) covers the state of Nebraska, in the Midwestern USA. In 2010, the population was 1.8 million, with about half of all residents living in or near the cities of Omaha and Lincoln. Hispanics are the largest minority group, accounting for 9.2% of the population. The non-Hispanic population is 82.1% White, 4.4% African-American, 1.7% Asian, and 0.8% Native American.

CANCER CARE FACILITIES

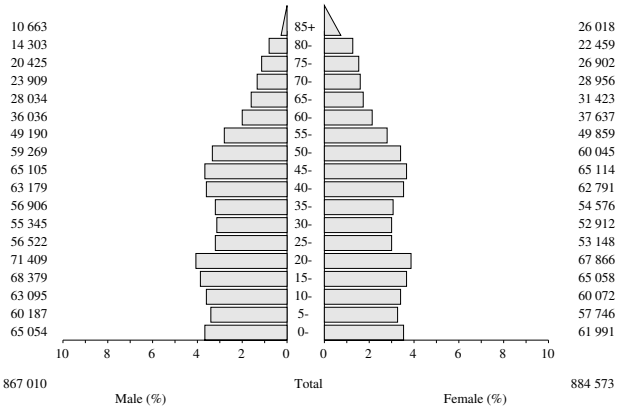
Of the 87 reporting hospitals, 12 have a cancer programme approved by the American College of Surgeons Commission on Cancer. Cancer patients also receive outpatient care at ambulatory surgery centres, radiation therapy centres, cancer clinics, and physicians' offices.

REGISTRY STRUCTURE AND METHODS

Since 1987, the NCR has gathered data on all Nebraska residents diagnosed with and/or treated for cancer. The NCR receives case reports from every hospital in Nebraska (except Veterans Health Administration facilities), as well as from pathology laboratories and physicians and through exchanges with registries in neighbouring states. The NCR also uses Nebraska death certificates and the National Death Index to identify cases. The registry is managed by the Nebraska Department of Health and Human Services (DHHS). However, the Nebraska Methodist Hospital in Omaha performs data collection, training, and quality assurance, whereas DHHS is responsible for data analysis and reporting. The registry receives federal funds from the National Program of Cancer Registries (NPCR) and state funds from the tobacco tax. The NCR employs four staff members at the Nebraska Methodist Hospital and six at DHHS.

INTERPRETING THE RESULTS

In 2009, the NCR achieved its 15th consecutive North American Association of Central Cancer Registries (NAACCR) Gold Certification for data completeness, timeliness, and quality. Survey data collected in Nebraska during this period by the telephone-based Behavioral Risk Factor Surveillance System showed increasing rates of colonoscopy screening for colorectal cancer and slightly decreasing rates of mammography screening for breast cancer.



USE OF THE DATA

The NCR publishes an annual report on cancer incidence and mortality, which is available from the DHHS website. Within DHHS, NCR data are used for planning and evaluation of cancer control activities and for investigating cancer clusters. The NCR also provides data to qualified researchers for epidemiological studies, and in response to individual requests for information.

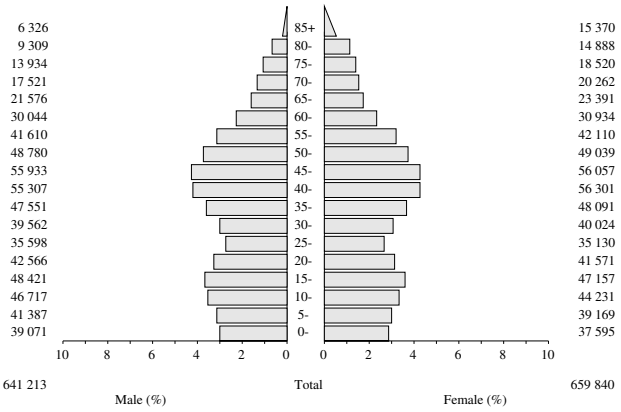
USA, New Hampshire

REGISTRATION AREA
The New Hampshire State Cancer Registry (NHSCR) collects incidence data on all cancer cases diagnosed or treated in the state of New Hampshire. New Hampshire is considered a rural state. There are large open spaces in the northern part of the state but major population centres in the southern part; 59% of residents live in urban areas and 96% are Caucasian.

CANCER CARE FACILITIES
There are 26 reporting hospitals and two free-standing oncology centres in New Hampshire.



REGISTRY STRUCTURE AND METHODS
Since its inception in 1985, the NHSCR has been contracted to the Geisel School of Medicine at Dartmouth College by the New Hampshire Department of Health and Human Services (DHHS) Division of Public Health Services. As required by the Administrative Rules of New Hampshire, the NHSCR collects reports from registrars in all large hospitals in the state. Hospitals with fewer than 105 cancer cases per year generally do not have their own cancer registry, and NHSCR staff members help these hospitals with their reporting duties. The NHSCR also receives case reports from physicians, free-standing radiation/oncology centres, out-of-state pathology laboratories, and other sources. The registry receives case reports for New Hampshire residents who are diagnosed outside the state through interstate data exchange agreements. The NHSCR conducts active death clearance trace-back and linkage to state death files and the National Death Index. Pathology audits are conducted at New Hampshire pathology laboratories to verify case ascertainment. Audits of discharge diagnosis codes are also conducted for case ascertainment purposes. The NHSCR is supported by the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR) through a cooperative agreement awarded to the DHHS (Division of Public Health Services, Bureau of Disease Control and Health Statistics, Health Statistics and Data Management section). The NHSCR has 4.5 full-time equivalent professional positions.

INTERPRETING THE RESULTS
New Hampshire supports two federally funded screening programmes for low-income individuals: the New Hampshire Breast and Cervical Cancer Early Detection Program (NHBCCEDP) and the New Hampshire Colorectal Screening Program (NHCRSP). The New Hampshire Comprehensive Cancer Collaboration is a federally funded programme that develops strategies to reduce cancer incidence and morbidity/mortality statewide.

USE OF THE DATA
The state of New Hampshire uses cancer registry data for public health planning and investigations, and makes data available for approved research. More information is available from http://www.dhhs.nh.gov/dphs/hsdm/cancer/.

USA, New Jersey

REGISTRATION AREA

The New Jersey State Cancer Registry (NJSCR) covers all 8.7 million residents of the state. New Jersey is located on the East Coast of the USA, bordered by the states of New York, Pennsylvania, and Delaware. At the 2010 census, the population of New Jersey was estimated to be 68.6% Caucasian, 13.7% African-American, 8.3% Asian, and 17.7% Hispanic (of any race).

CANCER CARE FACILITIES

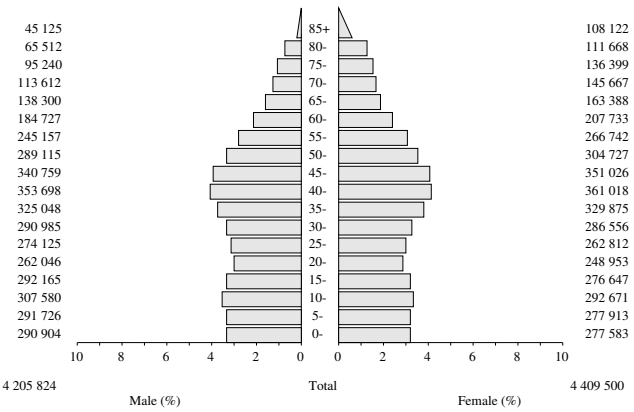
A total of 61 in-state hospitals, 60 surgery centres, and 24 free-standing radiation centres diagnose and treat cancer in New Jersey. In addition, many private physicians and in-office pathologists, dentists, psychiatric facilities, rehabilitation facilities, and nursing homes provide cancer services, and residents also have access to cancer centres in neighbouring states.

REGISTRY STRUCTURE AND METHODS

Cancer Epidemiology Services (CES) is located in the State of New Jersey Department of Health's Division of Epidemiology, Environmental and Occupational Health, and is financed by state and federal funds. There are 40 full-time and part-time staff members working on cancer registry and surveillance activities. Health care facilities are required by law to report cancer cases electronically within 3 months of discharge or 6 months of diagnosis, or face a penalty. The majority of cases are reported by hospitals. Matching with the department's other databases has also resulted in the identification of cases. More than 10 000 case reports are received annually from out-of-state sources through reciprocal reporting agreements. Definite and possible duplicates are resolved by staff members. Patients' vital status is updated through active and passive follow-up by linkage with state and national data sources. The NJSCR has achieved North American Association of Central Cancer Registries (NAACCR) Gold Certification.

INTERPRETING THE RESULTS

The registry's coverage area has not changed. Incidence rates of many types of cancer vary by race/ethnicity. Changes in cancer screening patterns have had impacts on breast, colorectal, cervical, and prostate cancers. The implementation of electronic pathology laboratory reporting has improved melanoma reporting.



USE OF THE DATA

CES monitors cancer incidence trends, disseminates data, and addresses citizens' concerns about cancer. It also publishes reports and articles based on registry data. The data are used for a wide range of purposes, including applications in cancer control and prevention, etiological studies, policy-making, and epidemiological research.

USA, New Mexico

REGISTRATION AREA

The New Mexico Tumor Registry (NMTR) covers New Mexico, which is the fifth largest state in the USA, with an area of 314 159 km^2. About one third of the state's 1.9 million residents live in the Albuquerque area; the remaining residents live in small cities, towns, and villages and in rural areas. New Mexico's diverse population includes Hispanics, American Indians, African-Americans, Asians, and non-Hispanic Whites. Many Hispanics in the state can trace their ancestry to Spanish colonists who settled in the area several centuries ago. The median education and income levels in New Mexico are among the lowest in the USA.

CANCER CARE FACILITIES

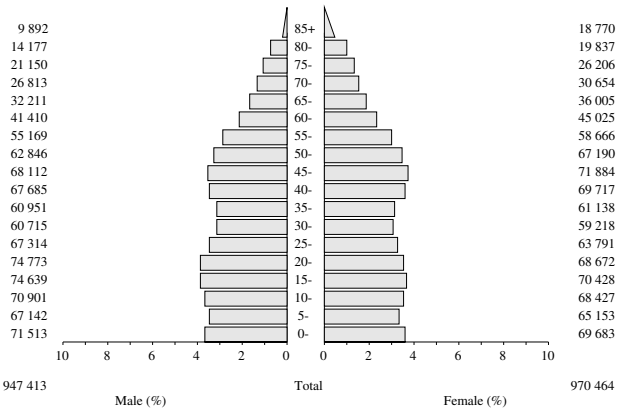
Cancer care is provided by public and private hospitals in population centres throughout New Mexico and in neighbouring states. Community-based oncologists, surgeons, and other health professionals are also key providers of cancer care.

REGISTRY STRUCTURE AND METHODS

The NMTR is a population-based registry that was established in 1966 and is a founding member of the National Cancer Institute's SEER Program. Cancer surveillance in New Mexico is a collaborative effort of the registry, the New Mexico Department of Health, the federal Indian Health Service, and – importantly – hospital-based cancer registrars, health care providers, and administrators. The registry also routinely receives information from registries and care providers in neighbouring states, for New Mexico residents who travel out of the state for cancer care. Cancer surveillance is conducted in accordance with the prevailing standards disseminated by the SEER Program and others.

INTERPRETING THE RESULTS

Cancer incidence, mortality, and survival vary (sometimes widely) among New Mexico's diverse racial/ethnic groups, so it is important to consider race/ethnicity when interpreting the NMTR's data. During 2003–2007, New Mexico had six cancer programmes that were accredited by the American College of Surgeons. Breast and cervical cancer screening programmes (for women aged 30–64 years) have been in place since 1992, with approximately 20% coverage.



USE OF THE DATA

The NMTR maintains a robust research portfolio, and many investigators use registry data for scientific studies. Statistics are routinely tabulated and disseminated through published reports and via the registry's website. The registry also collaborates with the New Mexico Department of Health to address cancer-related concerns and public health issues.

USA, New York State

REGISTRATION AREA

The New York State Cancer Registry (NYSCR) covers the state of New York. In 2005, the population was approximately 19 million; 66% Caucasian, 16% African-American, 0.5% American Indian, 7% Asian, and 17% Hispanic (of any race).

CANCER CARE FACILITIES

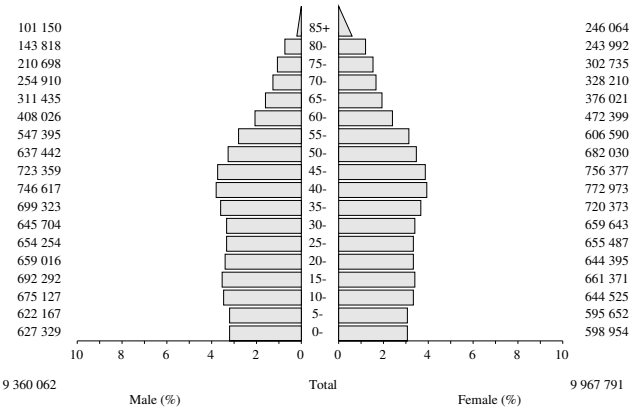
New York residents have access to almost 250 acute care hospitals, including 21 Community Hospital Comprehensive Cancer Programs and three National Cancer Institute (NCI)-designated Comprehensive Cancer Centers. There are 57 ambulatory surgery centres, 70 radiation treatment centres, 13 Veterans Health Administration hospitals, and many private physicians' offices that provide cancer services and report to the NYSCR. In addition to private insurance and federal Medicare, the state provides generous coverage to indigent residents through Medicaid. New York City has an extensive public hospital system.

REGISTRY STRUCTURE AND METHODS

The NYSCR was established by public health law in 1940 and is the second oldest central cancer registry in the USA. It has been population-based since 1976. The registry is located within the New York State Department of Health and is funded partly by the state and partly by the National Program of Cancer Registries (NPCR). The registry staff includes 24 certified tumour registrars. Notification is initiated by the reporting facilities. Encrypted reports (which include full personal identifiers and are mostly precoded) are received electronically in standard North American Association of Central Cancer Registries (NAACCR) formats. The addresses of all cases are geocoded to provide detailed geographical information for cancer surveillance and mapping.

INTERPRETING THE RESULTS

Screening for breast, cervical, colorectal, and prostate cancers is widespread in New York. According to the 2010 Behavioral Risk Factor Surveillance System, 78% of women aged 40 years or older had received a mammogram within the previous 2 years, 84% of women aged 18 years or older had undergone a Pap test within the previous 3 years, 68% of residents aged 50 years or older had received a sigmoidoscopy or colonoscopy within the previous 10 years, and 58% of men aged 40 years or older had undergone a prostate-specific antigen (PSA) test within the previous 2 years.



USE OF THE DATA

The registry annually prepares numerous tables of cancer statistics, which are available from http://www.health.ny.gov/statistics/cancer/registry/. The data are used extensively by public health programmes and health care providers for programme planning and evaluation. NYSCR data are also used by researchers throughout the USA for a variety of epidemiological studies.

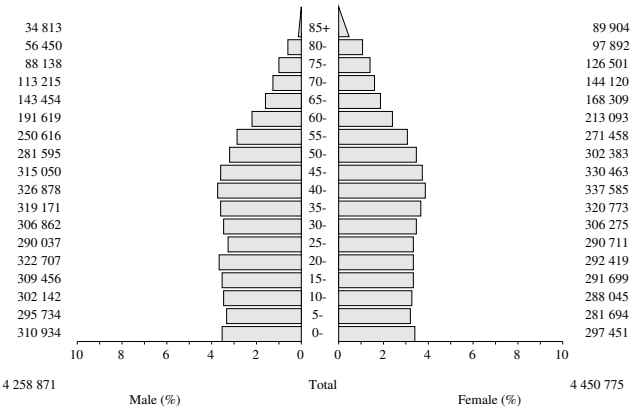
§Includes 2 cases of unknown age

§Includes 1 case of unknown age

USA, North Carolina

REGISTRATION AREA
The North Carolina Central Cancer Registry (CCR) is a statewide population-based cancer registry that covers all residents of the state of North Carolina in the USA. In 2012, the state's population was estimated at 9.8 million. The registry covers residents of all races and ethnicities.

CANCER CARE FACILITIES
The CCR receives most of its cancer incidence data from health care facilities (hospitals, cancer centres, and dermatology, urology, and surgical oncology centres). Incidence data also come from physicians' offices, pathology reports, interstate data exchange, nursing facilities, and death clearance cases.



REGISTRY STRUCTURE AND METHODS
The CCR is funded through state appropriations and the National Program of Cancer Registries (NPCR). The registry became operational in 1987 and has since increased its case ascertainment to more than 90%. The CCR is responsible for cancer surveillance throughout North Carolina, and its core mission is to collect timely cancer data, to analyse the data, and to disseminate the data to public health agencies and advocates, legislators, policy-makers, researchers, state and national organizations, and citizens of North Carolina. The CCR's case ascertainment is critical for identifying and monitoring areas of high cancer burden, and for facilitating programmes and policies that focus on early detection to improve cancer prevention and control outcomes among North Carolinians.

INTERPRETING THE RESULTS
North Carolina has screening programmes for breast cancer (among women aged 50–64 years, with 7% coverage) and cervical cancer (among women aged 18–64 years, with 10% coverage). Both programmes started in 1993.

USE OF THE DATA
North Carolina cancer incidence and mortality data are used for planning and evaluating health services at the county level, identifying high cancer incidence within certain counties, educating the public, motivating entities such as hospitals and physicians to report incidence data accurately and in a timely manner, and encouraging more hospitals to organize tumour registries to provide better service to their cancer patients. CCR data are available from the State Center for Health Statistics website (http://www.schs.state.nc.us/data/cancer.cfm).

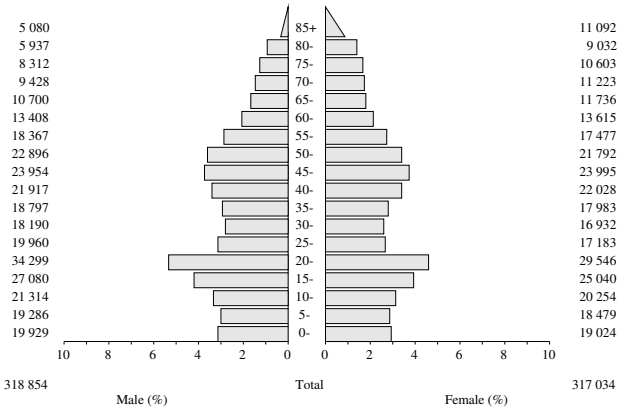
USA, North Dakota

REGISTRATION AREA
The North Dakota Statewide Cancer Registry (NDSCR) covers the population of the state of North Dakota in the USA. The state is mainly rural, with an estimated population of 700 000 in 2012. The population is 90% White, 5.5% American Indian, and 4.5% of other races.

CANCER CARE FACILITIES
All health care facilities, health care providers, and laboratories (including pathology departments) that provide outpatient or inpatient services to diagnose and/or treat cancer patients in North Dakota must report to the NDSCR. Approximately 93% of the registry's incident cases are obtained from the six major reporting facilities' cancer registry programmes. The rest of the data are obtained through out-of-state data-sharing agreements, death clearance processes, individual physicians' offices, clinics, etc.



REGISTRY STRUCTURE AND METHODS
The NDSCR is a statewide population-based cancer registry located at the University of North Dakota School of Medicine and Health Sciences (UND SMHS) Department of Pathology. The UND SMHS is the bona fide operating agent of the NDSCR. The registry is authorized by law to collect cancer data for the purpose of preventing and controlling the disease, and to conduct public health surveillance, public health investigations, and interventions. The NDSCR was established in 1994, and incidence and mortality data collection officially began in January 1997 through administrative ruling. All in situ cancers, malignant cancers, and benign cancers of the central nervous system are reportable, with the exception of basal and squamous cell skin cancers. Federal and state laws protect the confidentiality of the medical information received. To assure accurate, complete, and reliable data, various edit metafiles are used in addition to visual review, external audits, and internal case-finding and re-abstracting audits. When data are released for publication, cells containing fewer than 5 cases are suppressed for confidentiality.

INTERPRETING THE RESULTS
NDSCR data on incidence numbers/rates, stage, treatment, etc. are analysed to help determine where additional screening measures should be implemented.

USE OF THE DATA
The North Dakota Comprehensive Cancer Program is a major user of registry data, in the programme's cancer burden document. Registry data are also used to fulfil data requests (both public and private), address cancer cluster concerns, perform research analysis, and publish an electronic annual report.

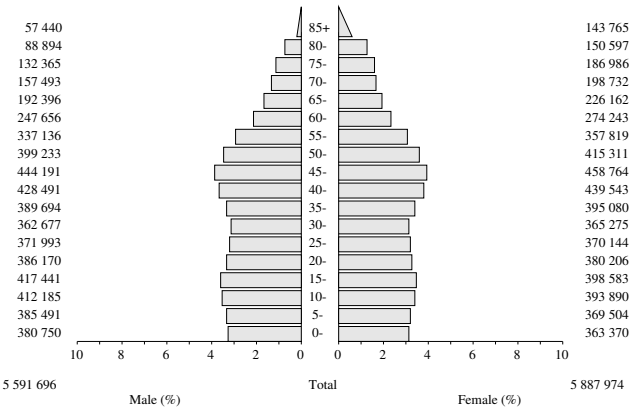
USA, Ohio

REGISTRATION AREA
The Ohio Cancer Incidence Surveillance System (OCISS) at the Ohio Department of Health (ODH) collects and analyses cancer incidence data pertaining to all residents of the state of Ohio in the USA. Information about Ohio is available from http://development.ohio.gov/files/research/C1001.pdf.

CANCER CARE FACILITIES
The OCISS collects cancer reports from hospitals, physicians' offices, laboratories, and outpatient ambulatory and radiation therapy centres.



REGISTRY STRUCTURE AND METHODS
The OCISS collects information on incident cases of cancer. The data collected include patient demographics and information on cancer diagnosis, staging, and first course of treatment.

INTERPRETING THE RESULTS
Together with a variety of partners inside and outside the ODH, the OCISS works to reduce the burden of cancer. Information about the cancer programmes administered by the ODH is available from the department's website (http://www.healthy.ohio.gov/cancer/cancprgms.aspx).

USE OF THE DATA
OCISS publications are available from the ODH website (http://www.healthy.ohio.gov/cancer/ocisshs/newrpts1.aspx).

USA, Oklahoma

REGISTRATION AREA

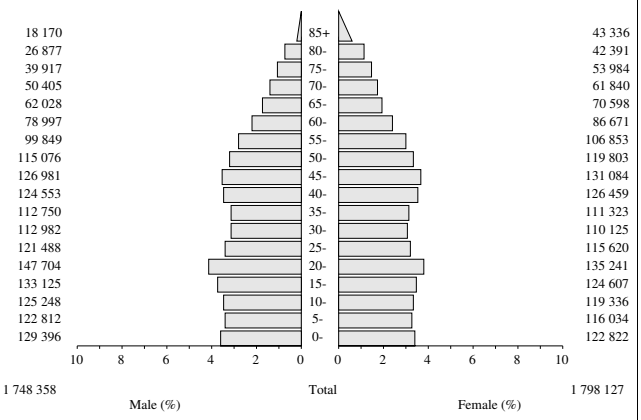
The Oklahoma Central Cancer Registry (OCCR) covers the population of the state of Oklahoma in the USA. Oklahoma is a primarily rural state, with 35% of the population living in the two major metropolitan areas and 16 of the state's 77 counties (20%) designated as completely rural by the United States Department of Agriculture – with fewer than 2500 residents each. Oklahoma has one of the largest populations of American Indians of any state in the USA, with 8.9% of residents identifying as American Indian by 2011 United States Census Bureau estimates.

REGISTRY STRUCTURE AND METHODS

The OCCR is housed within the Oklahoma State Department of Health, and the registry collects, processes, and maintains data on the approximately 20 000 cases of cancer diagnosed and treated each year among the approximately 3.5 million residents of Oklahoma. To maintain these data, the OCCR has a staff of 10 dedicated registrars who work with the wide variety of facilities and physicians throughout the state. These activities are supported by state law requiring the reporting of cancer cases to the OCCR within 180 days of diagnosis. The OCCR is funded to conduct these activities by the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR).

INTERPRETING THE RESULTS

Breast and cervical cancer screening programmes in Oklahoma are funded by CDC's National Breast and Cervical Cancer Early Detection Program. Oklahoma also has a state-funded screening programme for colorectal cancer.



USE OF THE DATA

The OCCR staff members are dedicated to providing complete, timely, and high-quality data to clinicians, researchers, and public health officials for use in programme planning, resource allocation, and support of cancer research and analysis in the state and the USA. One of the most impactful processes that the OCCR participates in is linkage with the database of the Indian Health Services, which provides more accurate racial identification for the American Indian population. After linkage, the age-adjusted incidence rates double in this population, due to the major influence of racial misclassification. Data collected by the OCCR are often used directly for cancer prevention and control activities within Oklahoma. For example, OCCR data, in combination with behavioural risk factor and mortality data, are used to identify priority populations throughout the state to better allocate resources for breast and cervical cancer screening.

§Includes 2 cases of unknown age

USA, Oregon

REGISTRATION AREA

The Oregon State Cancer Registry (OSCaR) covers the state of Oregon, in the north-western USA. Approximately 88.6% of residents are White, 3.9% are Asian/Pacific Islander, 2% are African-American, and 1.8% are American Indian/Alaska Native. About 81% of residents live in urban areas.

CANCER CARE FACILITIES

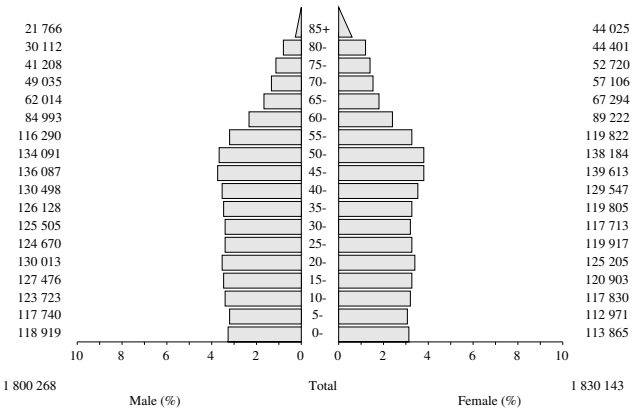
Cancer care is predominantly provided by 56 hospitals, 18 of which have cancer programmes approved by the American College of Surgeons Commission on Cancer. Additional services are provided by ambulatory surgery centres, free-standing cancer treatment facilities, physicians' offices, and clinics throughout the state.

REGISTRY STRUCTURE AND METHODS

OSCaR began collecting data in 1996 and is located within the Health Promotion and Chronic Disease Prevention Section of the Oregon Health Authority. It is funded through a cooperative agreement with the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR). Data come from a variety of sources, including hospital cancer registries, ambulatory surgical centres, physicians' offices, outpatient clinics, pathology laboratories, hospital medical records departments, registries in neighbouring states, and death certificate files. Information on patient survival is primarily obtained through regular record linkages with the Oregon death certificate, Social Security Death Index, and National Death Index databases.

INTERPRETING THE RESULTS

Since the inception of OSCaR, there have been no major changes in the reporting area, case definition, or coding, other than nationwide changes in standard-setting guidelines from the North American Association of Central Cancer Registries (NAACCR). The Oregon Breast and Cervical Cancer Program (BCCP) was established in 1994 to provide low-income, uninsured, and medically underserved residents with access to breast and cervical screening services. The programme enrols about 15% of the eligible population annually. According to Oregon Behavioral Risk Factor Surveillance System data, in 2011, approximately 75% of Oregon women aged 50–74 years had received mammograms within the previous 2 years, and 58% of Oregonians followed the current colorectal cancer screening recommendations.



USE OF THE DATA

The registry prepares an annual report on cancer incidence and mortality, highlighting cancer risks and trends. Other cancer control programmes use registry data for planning and evaluation. The registry collaborates with local and national researchers on a variety of special studies designed to reduce the burden of cancer in Oregonians.

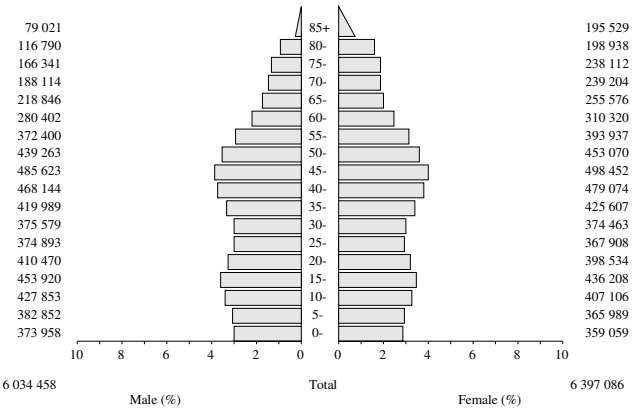
USA, Pennsylvania

REGISTRATION AREA
The Pennsylvania Cancer Registry (PCR) covers the state of the Commonwealth of Pennsylvania. In 2011, the population was 12.7 million, of whom 10.7 million were White and 1.4 million were Black. About 27% of residents lived in a rural county.

CANCER CARE FACILITIES
There are 169 acute care hospitals within the state.



REGISTRY STRUCTURE AND METHODS
The PCR collects demographic, diagnostic, and first course of treatment information on all cancers patients diagnosed and treated in the state, and is legally mandated. The PCR receives approximately 140 000 reports annually from 370 reporting sources. Increasing the reporting rates of free-standing laboratories and other non-hospital sources continues to be a challenge as more patients are being diagnosed and treated in these settings. The PCR uses current technology for collection, processing, and database management, and conforms to national data collection standards as recommended by the North American Association of Central Cancer Registries (NAACCR).

INTERPRETING THE RESULTS
Through participation in the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR), the PCR has significantly enhanced registry operations and has consistently achieved NAACCR Gold Certification. Since 1994, Pennsylvania has been awarded a grant for its Healthy Woman Program (HWP) through CDC as part of the National Breast and Cervical Cancer Early Detection Program (NBCCEDP). The HWP provides no-cost breast and cervical cancer screening services to the eligible population. Women diagnosed with cancer are referred for free treatment through the Department of Public Welfare. The HWP acts as a safety net programme to try to provide every woman with access to breast and cervical cancer screening.

USE OF THE DATA
Summary statistical information is published for general distribution and public knowledge. Requests for in-depth information are carefully screened and granted only for use in approved research studies. The PCR provides data for determination of cancer rates, state trends, cancer research, surveillance activities, and epidemiological and other special studies. State-specific incidence and mortality data are published annually in *Pennsylvania Cancer Incidence and Mortality*. Data from this and other statistical reports and publications are available through funding provided by participation in CDC's NPCR and are available from the Pennsylvania Department of Health's website (http://www.health.state.pa.us/stats/).

§Includes 1 case of unknown age

§Includes 1 case of unknown age

USA, Rhode Island

REGISTRATION AREA

The Rhode Island Cancer Registry (RICR) captures all cancer cases diagnosed and/or treated in the state of Rhode Island in the USA. The state is predominately urban, with a limited rural population. The population is 87% White (77% non-Hispanic White), 7% Black, and 3% Asian. Other races account for less than 1% of the population, and 3.3% of residents are of two or more races. Rhode Island has an ageing, mostly Catholic population. There are more residents older than 65 years and fewer residents younger than 18 years than the national averages. As younger Rhode Islanders leave, they are being replaced by a growing Hispanic population.

CANCER CARE FACILITIES

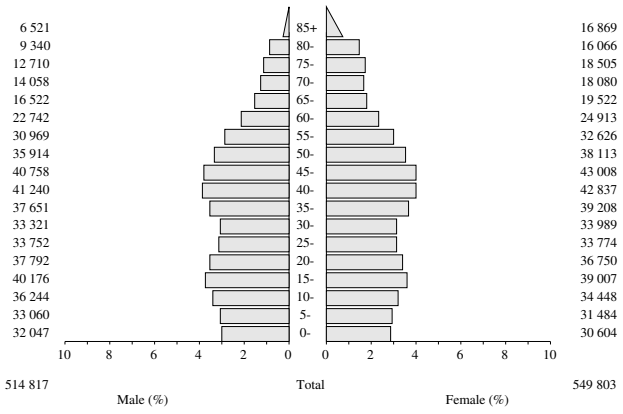
Rhode Island has 11 acute care hospitals (all of which have cancer programmes approved by the American College of Surgeons), five free-standing radiation therapy centres, and a small number of medical oncology practices. Health care costs are covered by private medical insurance, community health centres, and compassionate care provided by hospitals according to state law.

REGISTRY STRUCTURE AND METHODS

The RICR is supported by state law passed in 1986. Several revisions have been made to meet current reporting requirements. The Rhode Island Department of Health (DOH) contracts the Hospital Association of Rhode Island (HARI) to maintain the RICR, which is funded by the National Program of Cancer Registries (NPCR) and the DOH. Operational activities such as data collection and file preparation are conducted by employees filling 3.2 full-time equivalent positions at HARI. Surveillance and research are performed at DOH. Case reports are submitted electronically on cases diagnosed and/or treated in Rhode Island, and pathology reports are submitted from pathology laboratories nationwide. Case-finding audits are conducted quarterly, and 10% of all cases are audited annually. Cases are edited for duplicate reporting quarterly. Strong encryption is used to protect confidentiality.

INTERPRETING THE RESULTS

The reporting area has remained unchanged, and the population remains relatively stable. Treatment is increasingly centred at acute care hospitals. There have been no changes to coding or case definitions. Screening (with Pap tests and mammograms) is conducted by DOH as part of its Women's Cancer Screening Program.



USE OF THE DATA

Registry data are used by the DOH for surveillance and planning, as well as by researchers and hospital planners.

USA, South Carolina

REGISTRATION AREA

The South Carolina Central Cancer Registry (SCCCR) covers the state of South Carolina, which has a population of approximately 4.6 million (67% White, 32% Black, and 1% of other races). The proportion of Hispanic residents is increasing. South Carolina is considered to be 66% urban and 34% rural.

CANCER CARE FACILITIES

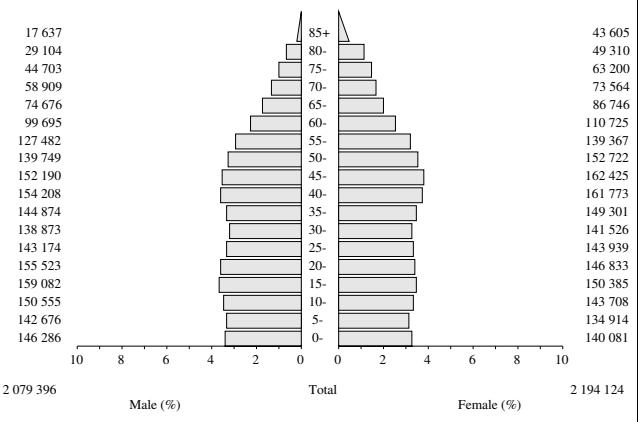
Comprehensive cancer services are provided by 17 hospitals with cancer programmes approved by the American College of Surgeons Commission on Cancer. Independent radiotherapy and medical oncology facilities also provide cancer treatment. The South Carolina Cancer Alliance (a coalition of cancer stakeholders) provides and evaluates the state's Cancer Prevention and Control Plan.

REGISTRY STRUCTURE AND METHODS

The SCCCR is located at the Department of Health and Environmental Control (DHEC) and is established through state law, with accompanying regulations specifying the data to be collected and the rules for data confidentiality and use. The SCCCR actively collects cases from hospitals, pathology laboratories, free-standing treatment centres, and selected physician specialities. Quality control is conducted via electronic edits and visual review of cases. All data are geocoded and used for spatial analysis to assess community cancer concerns.

INTERPRETING THE RESULTS

In South Carolina, the Best Chance Network (BCN) provides uninsured and underserved women aged 47–64 years with free breast and cervical cancer screening. The programme is funded by the United States Centers for Disease Control and Prevention (CDC) and provides services including mammograms, clinical breast exams, Pap tests, pelvic exams, diagnostic procedures, case management, and community education on breast/cervical cancer and early detection. Women who qualify for BCN services may also qualify for the Well-Integrated Screening and Evaluation for Women Across the Nation (WISEWOMAN) programme, which provides screening and referral to community resources for women to help reduce their risk of heart disease and stroke.



USE OF THE DATA

Data are submitted annually to CDC and the North American Association of Central Cancer Registries (NAACCR). The registry has achieved NAACCR Gold or Silver Certification for data completeness, timeliness, and quality each year since 1997. Data are used for cancer control planning, policy development, and evaluation of the state cancer plan, and are provided to external researchers. Public access to incidence and mortality data is provided on the DHEC South Carolina Community Assessment Network (SCAN) website, which provides interactive data queries, tables, and maps.

USA, South Dakota

REGISTRATION AREA

The South Dakota Cancer Registry (SDCR) is a population-based central cancer registry that collects data on all cancer patients who reside within the borders of the state of South Dakota in the USA, or who are diagnosed and/or treated for cancer in South Dakota. At the 2010 national census, the population of South Dakota was approximately 814 000. The population is 86% White, 9% Native American, 1% Black, 1% Asian, and 1% Native Hawaiian, Pacific Islander, or of other races. The remaining 2% of residents identified themselves as being of two or more races. There are equal proportions of males and females in the population; 25% of residents are aged 18 years or younger, and 34% are aged 50 years or older.

CANCER CARE FACILITIES

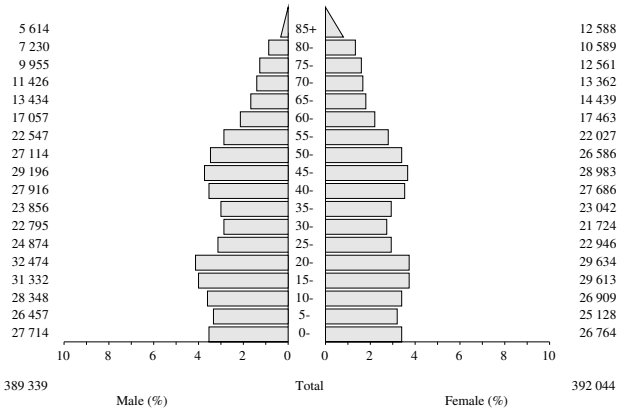
All health care providers in South Dakota that diagnose or treat cancer patients are required to report to the SDCR. Seven hospitals in the state have cancer registries. Of these, five have cancer programmes approved by the American College of Surgeons Commission on Cancer.

REGISTRY STRUCTURE AND METHODS

The registry is located within the South Dakota Department of Health. The reference year for the SDCR is 2001. The registry is funded by the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR). The SDCR has two full-time employees: a registry coordinator and a data manager. In addition, three Department of Health employees each dedicate 10% of their time to the SDCR: a chronic disease epidemiologist, a team leader, and an administrator.

INTERPRETING THE RESULTS

SDCR data meet NPCR and North American Association of Central Cancer Registries (NAACCR) standards for timeliness, completeness, and quality. The data also meet the criteria for inclusion in the *United States Cancer Statistics* and *Cancer in North America* publications. South Dakota has breast cancer, cervical cancer, and colorectal cancer screening programmes, and the state has implemented a human papillomavirus (HPV) and cancer prevention campaign that promotes the HPV vaccine.



USE OF THE DATA

SDCR data are used for surveillance of cancer incidence and mortality rates, programme planning and evaluation, epidemiological studies, and cancer cluster investigations.

CONTRIBUTOR

Kay Dosch

USA, South Dakota (2003-2007)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Based on the 2000 national census carried out by the United States Census Bureau, including intercensal estimates and bridged single-race estimates derived from the original multiple-race categories.

USA, Tennessee

REGISTRATION AREA

The central, population-based Tennessee Cancer Registry (TCR) covers the state of Tennessee, which has a population of slightly more than 6.3 million. Approximately 96% of Tennesseans are either Black or White, which is significantly more than the national average. Geographically, about half of the state is located within the Appalachian Region of the USA. About one third of Tennessee residents live in rural areas.

CANCER CARE FACILITIES

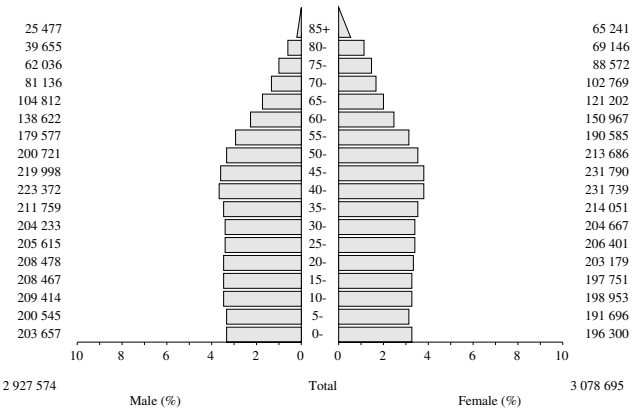
Tennessee has 34 cancer treatment programmes approved by the American College of Surgeons Commission on Cancer, distributed statewide.

REGISTRY STRUCTURE AND METHODS

The TCR collects data from a variety of sources. The most important sources are hospitals, pathology laboratories, and ambulatory surgical treatment centres. Other sources include physicians' offices, autopsy-only cases, and radiation treatment/medical oncology centres. The TCR has achieved North American Association of Central Cancer Registries (NAACCR) Gold Certification, indicating that the data collected by the registry meet the highest national standards of completeness and quality. The TCR has 10 employees and processes about 53 000 abstracts per year, which are consolidated into about 43 000 individual records. The TCR was established by an act of the Tennessee Assembly, with the passing of the Cancer Reporting System Act of 1983 (TCA 68-1-1001). The law was subsequently revised to ensure that Tennessee would be eligible for federal grant funding provided after the passage of Public Law 102-515 by the United States Congress in 1992. TCR operations are mostly funded through a cooperative agreement with the United States Centers for Disease Control and Prevention (CDC).

INTERPRETING THE RESULTS

The Tennessee Department of Health operates the Tennessee Breast and Cervical Cancer Early Detection Program, which provides cancer screening services to women aged 40 years or older who meet income requirements.



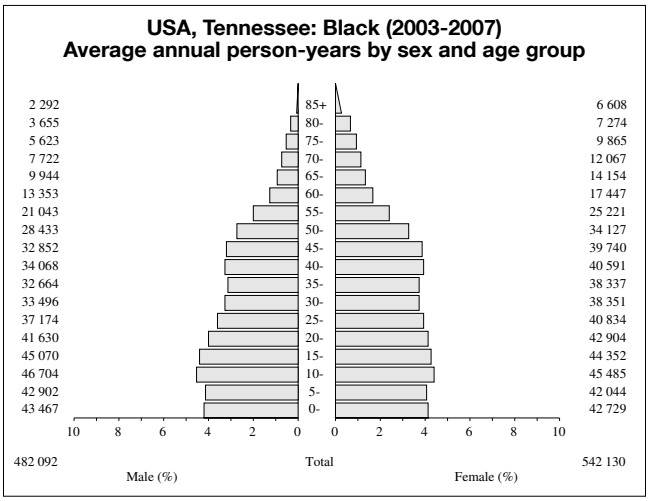
USE OF THE DATA

The TCR is required by law to produce an annual report on cancer incidence. Aggregate data are published annually in the report *Cancer in Tennessee*, which is provided to the gubernatorial administration and members of the Tennessee Assembly. The TCR also grants approximately 50–70 requests for aggregate data per year. Tennessee law allows for the sharing of individual-level cancer data, but only with qualified researchers for approved cancer research. TCR data are also used for planning cancer prevention and control activities, the goal of which is to reduce the overall burden of cancer in the state. On average, the TCR completes about 1–2 cancer cluster investigations annually, usually at the request of Tennessee residents.

CONTRIBUTOR

Martin Whiteside

USA, Tennessee (2003-2007)
Average annual person-years by sex and age group



SOURCE OF POPULATION

Based on the 2000 national census carried out by the United States Census Bureau, including intercensal estimates and bridged single-race estimates derived from the original multiple-race categories.

§Includes 1 case of unknown age

USA, Texas

REGISTRATION AREA

The Texas Cancer Registry (TCR) covers the state of Texas. At the 2010 census, the population was 25.1 million – a 17% increase since 2000. About 16% of the population is foreign-born. Non-Hispanic Whites make up 45% of the population, Blacks 12%, and Hispanics (of any race) 38%. Only 12% of residents live in rural areas, although rural areas account for more than half of the state's geographical area.

CANCER CARE FACILITIES

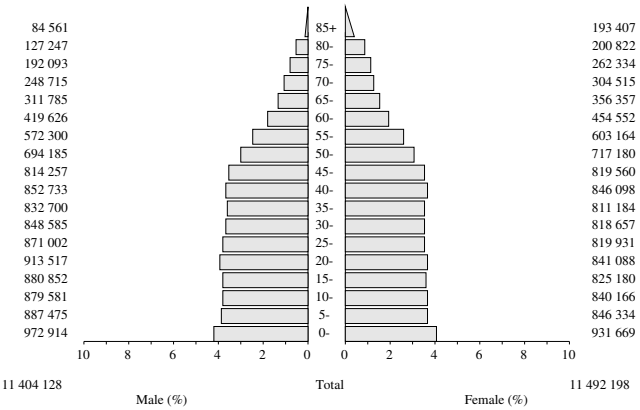
Cancer services are located primarily in the large metropolitan areas and are internationally recognized for their high-quality care. About 80% of Texas residents younger than 65 years and 99% of residents aged 65 years or older are covered by either private or public health insurance.

REGISTRY STRUCTURE AND METHODS

The TCR is a combination active and passive surveillance system responsible for the collection, maintenance, and dissemination of high-quality population-based cancer data on Texas residents. Confidential reporting without informed consent is mandated by law and has been population-based since 1995. In 2009, the registry's data sources included more than 500 public and private hospitals, cancer treatment centres, ambulatory surgery centres, and pathology laboratories. Vital status is ascertained at least annually from the state's Department of Vital Statistics and the National Death Index. The TCR consists of a central office and six regional offices and has 52 employees, 50% of whom are certified tumour registrars. In 2009, the registry received more than 248 000 reports of cancer; of these, more than 20 000 were for out-of-state residents, largely due to the internationally recognized cancer care available in Texas. These reports are distributed throughout the USA to other state cancer registries and make a significant contribution to the overall national cancer surveillance system.

INTERPRETING THE RESULTS

Since 2006, TCR data have met the highest quality standards as defined by the North American Association of Central Cancer Registries (NAACCR) and the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR). The Texas Comprehensive Cancer Control Program operates tobacco use cessation, breast cancer screening, and survivorship navigation programmes to reduce cancer risk, increase early detection and treatment rates, and enhance survivorship, respectively.



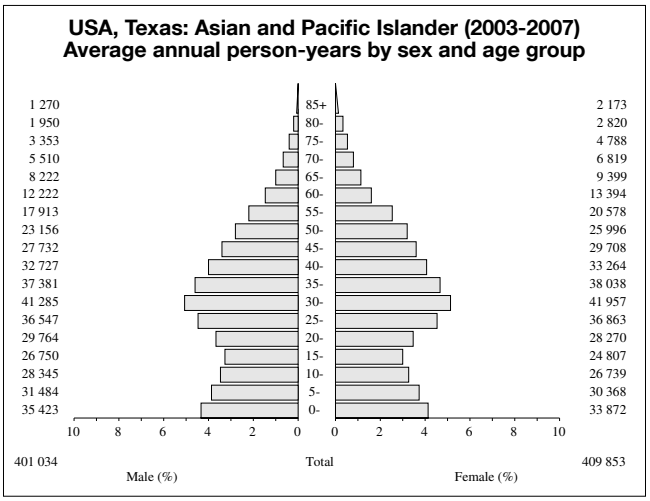
USE OF THE DATA

In addition to publishing annual reports on all cancers in Texas and specialized reports on particular cancers, the TCR also reports at least annually on cancer incidence, mortality, and survival, as well as expected cases and deaths and estimated prevalence, both through the TCR website and in print publications.

CONTRIBUTOR

Melanie Williams

USA, Texas (2003-2007)
Average annual person-years by sex and age group



SOURCE OF POPULATION

Based on the 2000 national census carried out by the United States Census Bureau, including intercensal estimates and bridged single-race estimates derived from the original multiple-race categories.

USA, Utah

REGISTRATION AREA

The Utah Cancer Registry (UCR) covers the population of the state of Utah in the USA. In 2012, the population of Utah was estimated at 2.9 million. The state is mostly rural, but 80% of the population lives along the Wasatch Front, an urban area in northern Utah. Utah's population is 79.9% non-Hispanic White and 13.3% Hispanic, with the remaining minority groups relatively evenly distributed.

CANCER CARE FACILITIES

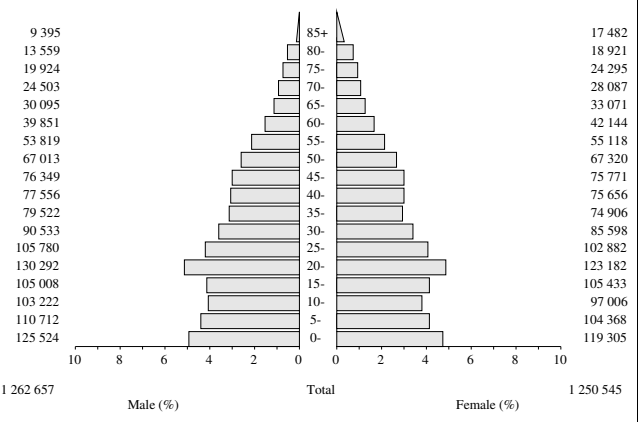
There are 51 hospitals, two radiation clinics, and numerous nursing homes and hospice care clinics in Utah that report cancer cases to the UCR.

REGISTRY STRUCTURE AND METHODS

The UCR is a population-based cancer registry that has served the state of Utah since 1966. The registry's primary funding comes from the National Cancer Institute (NCI), with supplementary funding from the University of Utah and the Utah Department of Health (DOH). Research supported by the UCR is funded by Contract No. HHSN261201000026C from the NCI's SEER Program, with additional support from the Utah DOH and the University of Utah.

INTERPRETING THE RESULTS

The UCR regularly ranks among the top registries in the USA. The registry has achieved North American Association of Central Cancer Registries (NAACCR) Gold Certification and has received one of the highest awards given by the SEER Program each year for more than a decade. Since its inception in 1966, the UCR has provided cancer surveillance for the entire state of Utah. Although the Utah DOH provides limited breast and cervical cancer screening programmes for low-income women, there has been no noticeable impact on incidence or mortality rates in Utah.



USE OF THE DATA

The UCR contributes to public health in Utah by collecting and maintaining cancer data, which makes the monitoring of incidence and mortality trends and the evaluation of prevention and control measures possible. One of the major functions of the UCR is to serve as a resource for researchers, physicians, hospitals, and the Utah DOH. Other functions include serving as an educational and data resource for physicians and institutions, stimulating research into all aspects of cancer in Utah, and promoting state-of-the-art cancer diagnosis and treatment. UCR data are included in the NCI's annual report to the nation on cancer, as well as in national and international publications by NAACCR and IARC. The registry also provides cancer data to the Utah DOH for population-based cancer publications and surveillance. A list of publications using UCR data is available from http://ucr.utah.edu/research/publications/index.htm.

USA, Vermont

REGISTRATION AREA

The Vermont Cancer Registry (VCR) covers the population of the state of Vermont in the USA. At the most recent census (2010), the population was 626 000. About 39% of Vermont residents live in urban areas (i.e. areas designated by the United States Census Bureau as urbanized areas and/or urban clusters); 95% of residents are White, and 5% are of other races.

CANCER CARE FACILITIES

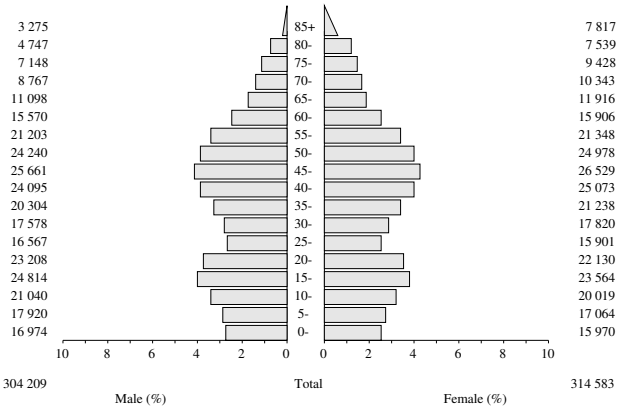
General health care in the region is provided predominantly by 15 hospitals, including a Veterans Affairs medical centre. This is supplemented by private practitioners and one outpatient radiation therapy facility. Approximately 91% of Vermont residents have health insurance.

REGISTRY STRUCTURE AND METHODS

The registry is located within the Vermont Department of Health. It is funded by the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR) and in-kind support from reporting hospitals. The registry is staffed by a full-time director, a health data administrator, an education and quality coordinator, and an epidemiologist. Cancer is required to be reported by Vermont health care facilities and health care providers. Interstate data exchange agreements exist with all bordering states and the state of Florida. Electronic editing, visual editing, and hospital auditing are all used as quality assurance strategies. The cancer registry is linked with the Vermont death file annually. Non-matches are traced back to identify cases potentially unreported to the VCR. These cases are traced back with providers to determine their reportability. Records that cannot be traced back to source records are accessioned as death-certificate-only (DCO) cases.

INTERPRETING THE RESULTS

The VCR data are estimated to be at least 95% complete at 24 months after the close of the diagnosis year. Ladies First is a health screening programme for Vermont women that removes financial barriers and encourages women to be screened for breast and cervical cancer.



USE OF THE DATA

In collaboration with Vermont cancer programmes, the VCR publishes reports that include age-adjusted incidence rates, stage at diagnosis, and age-adjusted mortality rates using SEER site groups, stratified by sex and geographical area where applicable. VCR data are used for planning and evaluation of cancer control objectives. Reports are published with an emphasis on screening-amenable cancers (i.e. breast, cervical, and colorectal cancers) diagnosed at late stage and cancers associated with modifiable risk factors (e.g. tobacco use, obesity, and human papillomavirus infection).

SOURCE OF POPULATION

Based on data from the United States Census Bureau. The intercensal estimates for 2000–2010 were produced by modifying the previously prepared 2000–2010 postcensal estimates to account for differences between the postcensal estimates for 1 April 2010 and the 2010 national census counts.

USA, Virginia

REGISTRATION AREA

The Virginia Cancer Registry (VCR) covers the state of Virginia, which has a mixed urban (about 75%) and rural (about 25%) population. The population is approximately 80% White, 19% Black, and 1% Asian.

CANCER CARE FACILITIES

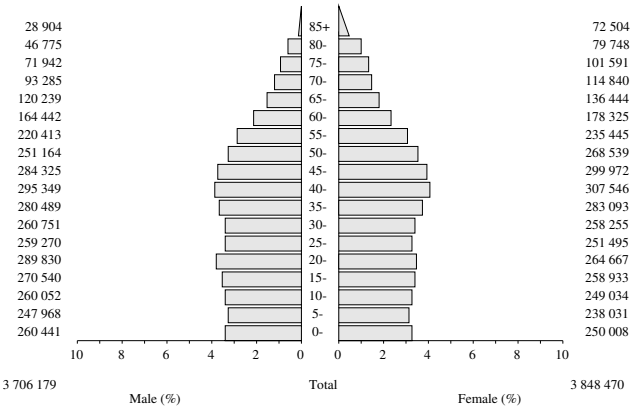
The urban areas are served by more than 60 hospitals and multiple large oncology practices. Insurance coverage is similar to that in other states of the USA; the Affordable Care Act will enable more citizens to afford cancer care.

REGISTRY STRUCTURE AND METHODS

State law established the VCR, and the Virginia State Board of Health regulates its activities. The VCR meets all standards of the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR) and conforms to the data standards published by the North American Association of Central Cancer Registries (NAACCR). All hospital data (and increasingly laboratory data) are received electronically. The registry requires reporters to conform to NAACCR data transmission standards. The VCR performs active trace-back to accomplish annual death clearance activities. Annual quality assurance activities include auditing a 20% sample of reporting facilities, assessing internal record consistency, and providing on-site training for reporters.

INTERPRETING THE RESULTS

The VCR operates with two other Virginia Department of Health programmes: the Comprehensive Cancer Control Program and the Breast and Cervical Cancer Early Detection Program (which screens women for breast and cervical cancer). The registry cooperates with this screening programme through an annual matching project.



USE OF THE DATA

The VCR produces the annual report *Burden of Cancer in Virginia*, which characterizes common cancers in the state. The registry also maintains a website that provides incidence statistics in tabular and graphical form. Registry data are used primarily for public health activities, including developing policy and procedures, collaborating with local authorities to investigate suspected cancer clusters, and disseminating aggregate statistics. Cancer researchers regularly submit requests to use registry data, which are granted after institutional review board approval. The VCR transmits data to the NPCR for inclusion in the publication *United States Cancer Statistics*. The annual NAACCR publication *Cancer in North America* also incorporates VCR data. The VCR participates in research projects, including the CONCORD programme at the London School of Hygiene & Tropical Medicine and the CDC research project Cancer Survival in Appalachia.

USA, Washington State

REGISTRATION AREA

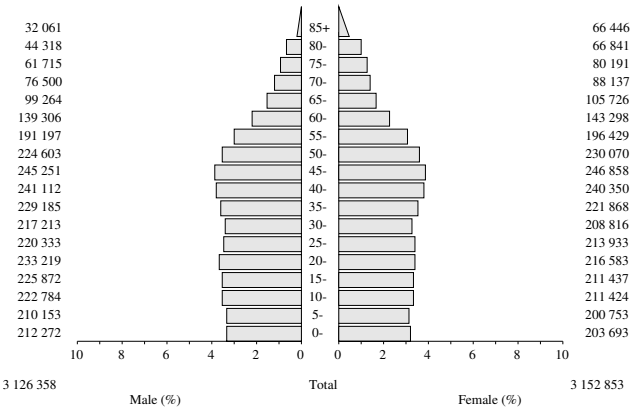
The Washington State Cancer Registry (WSCR) covers the population of the state of Washington, which is located in the Pacific Northwest region of the USA, sharing its northern border with Canada.

REGISTRY STRUCTURE AND METHODS

The WSCR is housed at the Washington State Department of Health and is responsible for the collection of all reportable conditions (cancers, non-malignant brain and central nervous system tumours, and reportable haematopoietic conditions) within the state. The registry is funded by the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR), and state general funds. State law requires hospitals and health care professionals to submit case information to the registry within 6 months of diagnosis or first treatment visit. The WSCR also reviews pathology reports to ensure complete case capture. Death certificates are reviewed annually to update case records and vital status and to identify potentially missed cases. The WSCR follows the coding guidelines set by the North American Association of Central Cancer Registries (NAACCR). ICD-O-3 is used as the standard reference for coding topography and morphology.

INTERPRETING THE RESULTS

The WSCR has consistently met or exceeded the following data quality criteria for all cancer sites combined included in this data submission: case ascertainment is at least 95% complete; fewer than 5% of cases are ascertained solely on the basis of a death certificate; no more than 3% of cases are missing information on sex or age; no more than 5% of cases are missing information on race; and at least 97% of the registry's records passed a set of computerized edit checks.



USE OF THE DATA

The WSCR electronically transmits data to CDC annually, using a standardized NAACCR record layout and coding system. The data are also used to support the work of public health professionals, health care delivery professionals, and researchers, and to support investigations of possible cancer clustering issues. An annual report on cancer in the state is published for informational purposes and is available from https://fortress.wa.gov/doh/wscr/WSCR/.

§Includes 1 case of unknown age

USA, Washington, Seattle

REGISTRATION AREA

The Cancer Surveillance System (CSS) operates under the SEER Program to provide incidence and follow-up data on all newly diagnosed malignancies (except non-melanoma skin cancers and cervical carcinoma in situ) in residents of 13 counties in the north-west of Washington state. The CSS reporting area contains about 70% of the state's population. Approximately 86% of the residents in the CSS reporting area live in the metropolitan areas of Seattle–Bellevue–Everett (57.7%), Tacoma (17.5%), Bremerton (5.6%), and Olympia (5.1%). In 2000, the population was 80.4% White, 5.3% Hispanic, 4.2% Black, 7.2% Asian, 1.4% Native American, and 1.5% of other races.

CANCER CARE FACILITIES

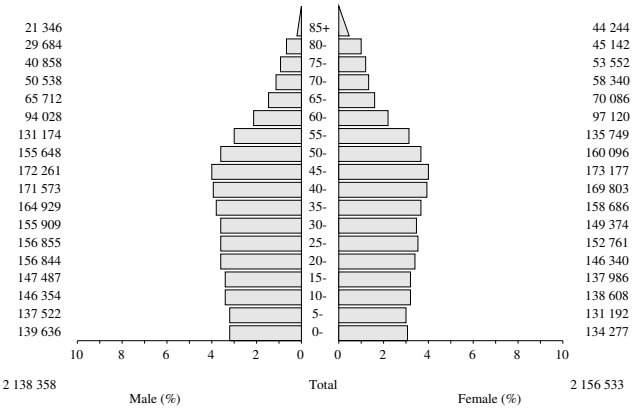
Cancer patients throughout the CSS catchment area have extensive access to the most advanced diagnostic and treatment facilities.

REGISTRY STRUCTURE AND METHODS

The registry is located within the Fred Hutchinson Cancer Research Center (FHCRC) and is funded primarily by the SEER Program and partly by the FHCRC and the Washington State Department of Health. The registry's approximately two dozen highly trained cancer registration technical staff members are supported by information technology and administrative personnel. The CSS uses active case finding from hospitals, clinics, pathology laboratories, and death certificates. All case finding is performed by CSS staff members. Abstraction and coding of medical records is performed by a mix of hospital staff members and registry staff members. Editing, case consolidation, and quality control activities are performed by CSS staff members. Both active and passive follow-up methods are used. Death clearance and unduplication activities are performed annually.

INTERPRETING THE RESULTS

There are no circumstances within the registry area that are particularly different from those of any other region with a highly medicalized society. There are no screening programmes that target the general population, but the Washington State Department of Health supports clinics that provide low-cost or no-cost breast, cervical, and colorectal cancer screening.



USE OF THE DATA

The CSS provides monthly reports to all reporting hospitals. Identifying information is reported only to the reporting physician or institution, to FHCRC investigators conducting research approved by the institutional review board, and to the Washington State Department of Health. Statistical reports for publication contain no data identifying patients, physicians, or institutions. De-identified patient-level data, as well as aggregate information (e.g. incidence and survival rates by age), are released to scientists working at the local, regional, national, and international levels, through the SEER Program and http://www.cancer-rates.info/.

USA, West Virginia

REGISTRATION AREA

The West Virginia Cancer Registry (WVCR) covers the entire state of West Virginia, the population of which is 94% White and 1.2% Hispanic. Compared with national averages, West Virginians have lower educational attainment (81.6% of residents aged 25 years or older have a high school education or higher, vs the national average of 84.6%), a lower per capita income (US$ 20 891 vs US$ 27 041), and a higher median age (41.3 years vs 37.2 years). West Virginia is a rural state, with only 46.1% of the population living in urban areas.

CANCER CARE FACILITIES

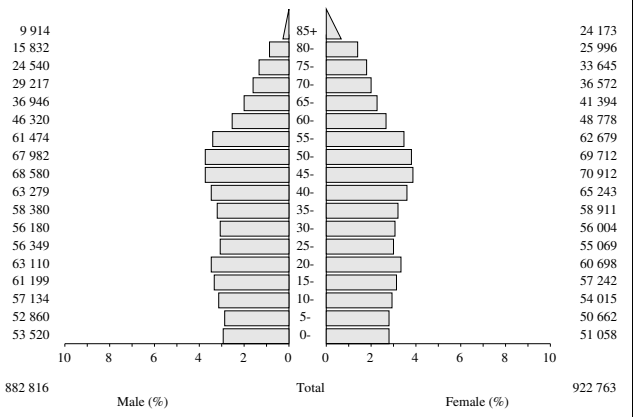
As of October 2011, 51 of West Virginia's 55 counties were classified by the United States Department of Health and Human Services as medically underserved or as having medically underserved populations. West Virginia has 52 hospitals, 12 of which have cancer programmes approved by the American College of Surgeons Commission on Cancer.

REGISTRY STRUCTURE AND METHODS

The WVCR is funded by the state of West Virginia and the United States Centers for Disease Control and Prevention's (CDC's) National Program of Cancer Registries (NPCR) and has 10 full-time staff members. The registry receives electronic reports from hospitals with cancer registries and provides abstracting services to other hospitals and physicians' offices. The WVCR also conducts linkages with death certificates and breast and cervical cancer screening programme data. Registry staff members perform computerized edits on all data and visual editing on at least 10% of cases from each reporter.

INTERPRETING THE RESULTS

West Virginia has higher levels of certain cancer risk factors (including tobacco use and obesity) than national averages. Screening rates for breast and cervical cancer are similar to national averages, as is the prostate-specific antigen (PSA) testing rate. Colonoscopy and sigmoidoscopy rates are lower than national averages.



USE OF THE DATA

The WVCR publishes an annual report on cancer incidence and mortality, conducts investigations of possible cancer clusters, performs analyses for special projects, promotes the use of WVCR data in planning and evaluation of cancer control activities, and provides de-identified data to approved researchers.

REGISTRATION AREA

The Wisconsin Cancer Reporting System (WCRS) covers the state of Wisconsin, which had a population of 5.7 million at the 2010 census. Approximately 89% of residents are White, 6% are African-American, 1% are American Indian or Alaska Native, 2% are Asian or Pacific Islander, and 6% of residents are of Hispanic origin. The poverty rate is 12.5%, and about one third of residents live in rural areas.

CANCER CARE FACILITIES

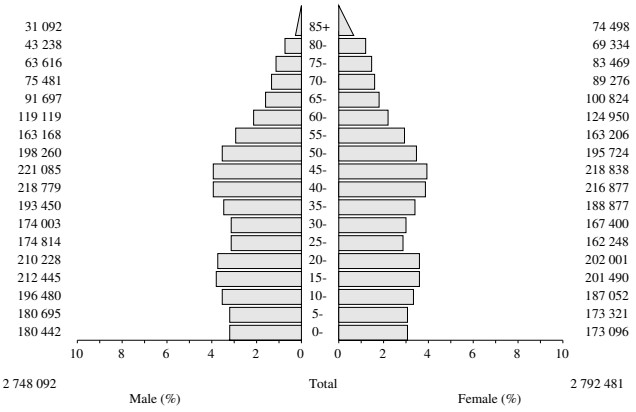
Wisconsin has 130 hospitals, 235 clinics (including radiation therapy centres, health maintenance organization outpatient clinics, and private physician offices), and four pathology laboratories. Residents living near state borders may cross into other states for cancer diagnoses and care.

REGISTRY STRUCTURE AND METHODS

The WCRS is located within the Wisconsin Division of Public Health. It is funded by general purpose revenue funds (25%) and the United States Centers for Disease Control and Prevention (CDC) through the National Program of Cancer Registries (NPCR) (75%). The registry has seven full-time employees. It passively collects data from state sources and out-of-state hospitals along the state borders. The WCRS has data exchange agreements with 20 other state central cancer registries and conducts annual links with Wisconsin death records and the National Death Index. Annual follow-up is conducted on death-certificate-only (DCO) cases. Cancer is a reportable disease in Wisconsin. Submitted data are processed using a combination of NPCR-required and NPCR-recommended edits and Wisconsin-specific edits. The WCRS has achieved NAACCR Silver or Gold certification for 13 of the past 15 years and received the 2013 Registry of Excellence award from the NPCR.

INTERPRETING THE RESULTS

The Wisconsin Well Woman Program is a health screening programme for uninsured and underinsured women aged 45 years or more. The programme removes financial barriers that can prevent many women from being screened for breast and cervical cancer.



USE OF THE DATA

The WCRS provides state and county data by cancer site, sex, race/ethnicity, and stage of disease on its public-use data query webpage (http://www.dhs.wisconsin.gov/wish/cancer/). The registry partners with the American Cancer Society to produce the biannual *Wisconsin Cancer Facts & Figures* report. Upon request, WCRS data are also provided to external researchers who meet statutory requirements, and have been included in numerous specialized studies of cancer incidence and mortality, as well as health services studies. WCRS data are published in the NAACCR report *Cancer in North America* and the CDC publication *United States Cancer Statistics*.

USA, Wyoming

REGISTRATION AREA

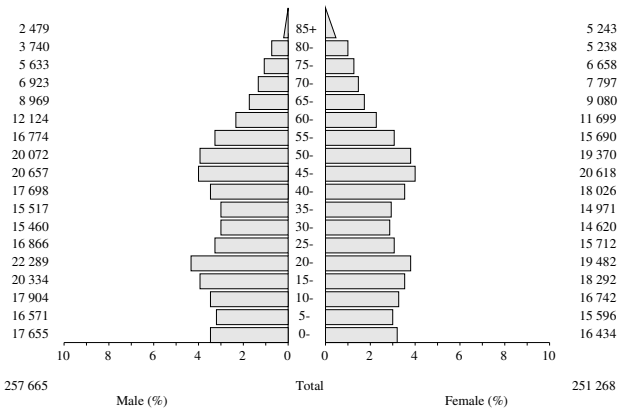
The Wyoming Cancer Surveillance Program (WCSP) is a statewide population-based cancer registry that covers the population of the state of Wyoming, which is estimated at 564 000. Almost the entire state is considered to be rural/frontier, except Laramie and Natrona counties; 17 counties (home to 47% of the population) have fewer than six residents per square mile and are considered frontier. The population of Wyoming is 93% White. Native Americans are the next largest racial group, accounting for 2.6% of the population.

CANCER CARE FACILITIES

Health care facilities involved in the diagnosis and/or treatment of cancer patients include hospitals, radiation oncology centres, cancer centres, physicians' offices, and outpatient surgical centres.

REGISTRY STRUCTURE AND METHODS

The WCSP's mission is to maintain a nationally comparable population-based cancer incidence, follow-up, treatment, and mortality monitoring system that collects, analyses, and disseminates information on all new cancer cases in Wyoming. The WCSP has been in operation since 1966 and has collected cancer data on all cancer cases diagnosed or treated in Wyoming since 1962. The registry monitors cancer incidence through pathology reports and uniform reporting of information by health care providers in Wyoming. In 1977, a law was passed requiring reporting by all entities detecting, diagnosing, and treating cancer cases in Wyoming: Statute 35-1-240(b) and Public Law 102-515.



USE OF THE DATA

The WCSP produces an annual report on cancer in Wyoming. Registry data are also used for flyers and data briefs by the Wyoming Breast and Cervical Cancer Early Detection Program (WBCCEDP), the Wyoming Colorectal Cancer Screening Program (WCCSP), and the Wyoming Comprehensive Cancer Control Program (WCCCP).

Bahrain: Bahraini

REGISTRATION AREA

The Bahrain Cancer Registry (BCR) covers the Kingdom of Bahrain, an island country located off the southern shores of the Arabian Gulf, with a total area of 8269 km^2. In 2010, the total population was more than 1.2 million (569 000 Bahrainis and 666 000 non-Bahrainis). About 88.6% of residents live in urban areas.

CANCER CARE FACILITIES

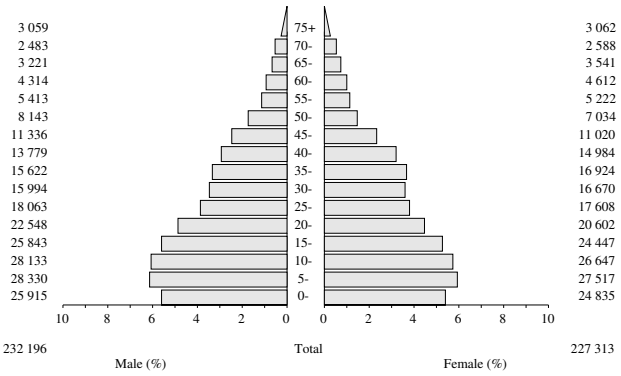
High-quality comprehensive health care is provided to all residents. Primary health care is delivered by 27 well-equipped health centres throughout the country. Secondary care is provided at the main government hospital, Salmaniya Medical Complex (SMC), which has an oncology services centre equipped with the latest diagnostic and treatment technology. The Bahrain Defence Force Royal Medical Services hospital is another major general secondary hospital, serving primarily Bahrain Ministry of Defence employees and their families. King Hamad University Hospital is the third largest government hospital, with 373 beds. Secondary care is also provided by six private hospitals.

REGISTRY STRUCTURE AND METHODS

The BCR collects data on tumour type, anatomical site, and histology, and data on tumour stage, basis of diagnosis, and hospital of treatment and referral. The information is then added to the registry database and checked for duplication and consistency using CanReg4. Cancer notification became mandatory for all physicians in 1994. In 2010, an electronic notification form was made available to all health care facilities. BCR registrars also perform active data collection by visiting sources to abstract data. Residents diagnosed abroad are traced through the SMC's Oncology Outpatient Register, and data are subsequently extracted from their medical records.

INTERPRETING THE RESULTS

Some underreporting of cases treated in private hospitals or abroad is expected. However, Bahrain is a small country, and its free cancer treatment facilities are located in a single public hospital, providing the opportunity to identify previously unreported cases. Cases are also identified through the national death register. Duplication and cases of unknown age are uncommon due to the unique identification number assigned to each resident.



USE OF THE DATA

The registry regularly publishes statistical reports on the distribution of various types of cancer by age, sex, and nationality. These reports are used by health planners and policy-makers to address cancer-related issues, allocate resources, and evaluate cancer prevention and control activities.

China, Beijing City

REGISTRATION AREA

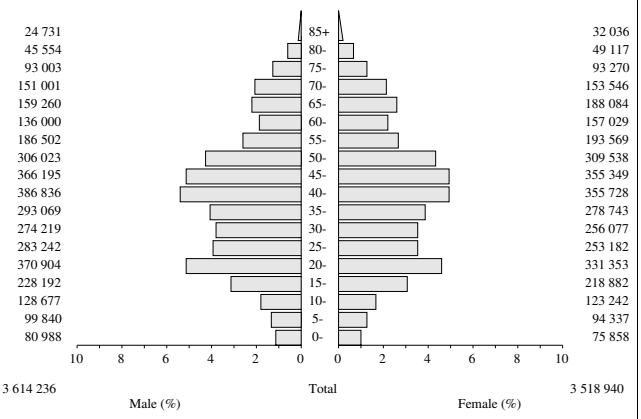
Beijing is the capital of China, located in the north of the country. It has a typical temperate zone continental monsoon climate. The Beijing Cancer Registry covers eight urban districts of the city, with a combined area of 1368.3 km^2. In 2007, the covered population was about 7.4 million (95.7% Han Chinese).

CANCER CARE FACILITIES

About 96% of residents are covered by medical insurance. More than 140 hospitals (some of which have cancer departments), including two specialist cancer hospitals, report newly diagnosed cancer cases to the registry. There are 134 community health service centres conducting active patient follow-up.

REGISTRY STRUCTURE AND METHODS

The registry was founded in 1977 and is now affiliated with the Peking University Cancer Hospital and the Beijing Institute for Cancer Research. Financial support comes mainly from the Beijing Municipal Health Bureau and China's National Central Cancer Registry. New cases are passively collected electronically from hospitals' health information systems and actively re-abstracted. Every hospital has one or two part-time registrars to help collect data. The registry database only includes information on permanent residents of Beijing. Suspected duplicate cases are examined by registry staff members. For incomplete cases, staff members visit the treating hospitals to re-abstract medical records to improve data quality. Death certificates are collected annually from the Vital Statistics Section of the Beijing Center for Disease Control and Prevention. If a death certificate shows an unregistered cancer case, the case is registered after trace-back. The vital status of registered patients is ascertained through both active and passive follow-up.



USE OF THE DATA

The registry submits an annual report of cancer incidence, mortality, survival, and time trends to various Beijing health administrative departments for the purpose of informing policies and decisions on cancer prevention and control. Registry data are also used in descriptive and analytical epidemiological studies.

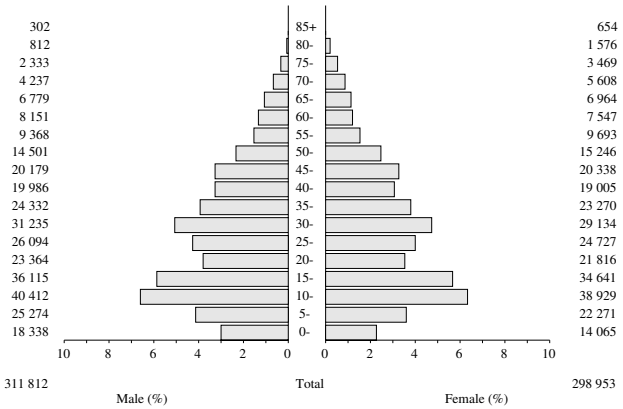
China, Cixian County

REGISTRATION AREA

The Cixian Cancer Registry covers the county of Cixian at the southern tip of Hebei Province in China. Cixian contains 19 towns and villages, has a population of 620 000, and has an area of 1014 km^2, most of which is mountains, hills, and plains.

REGISTRY STRUCTURE AND METHODS

The registry, established in 1973, operates within a three-level (county, township, and village) cancer prevention network. All-cause disease mortality and cancer incidence data are coded according to ICD-10 and ICD-O-3, respectively. Due to the convenient transportation and easily accessible health services in Cixian, the rate of pathological diagnosis is relatively high. The registry became a member of IACR in 1996.



INTERPRETING THE RESULTS

Cixian has been selected as a national demonstration centre for both cancer registration and early detection and treatment of oesophageal cancer. An endoscopic screening programme was initiated in 2002 among residents aged 40–69 years, which improved the rate of early detection and treatment of gastrointestinal cancer in the county.

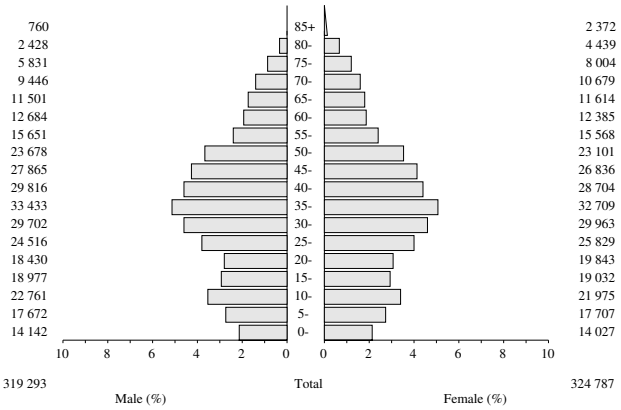
China, Haining County

REGISTRATION AREA
The Haining County Cancer Registry covers the county-level city of Haining in eastern China. The city's area is 693.5 km^2 and the population is about 640 000. The majority (99.6%) of residents are Han Chinese.

CANCER CARE FACILITIES
There are five major public hospitals, one cancer hospital, and 11 community hospitals. The cancer hospital provides radiotherapy services. All the hospitals report new cancer cases and benign tumours of the brain and central nervous system, as well as all causes of death. The population is covered by government health insurance.



REGISTRY STRUCTURE AND METHODS
Information on incident cancer cases is collected from clinicians and sent to public health physicians in the community hospitals, who then conduct follow-up and trace-back. The information is then reported to the registry, which is responsible for registration, coding, and entry of the data into the database. Investigations of registration quality are conducted twice per year. Since 2009, cancer cases have been reported through the online chronic diseases surveillance system of the Zhejiang Provincial Center for Disease Control and Prevention. The registry uses the IARC/IACR rules (2000) for multiple primary tumours.

INTERPRETING THE RESULTS
Factors that might affect incidence rates include improvements in the standard of medical care and diagnostic technologies, increases in insurance policy coverage, the ageing of the population, and changes in dietary habits.

USE OF THE DATA
Registry data are used mainly for surveillance and reporting of cancer incidence, analysis of survival rates, evaluation of treatment effects, and support for planning strategies for cancer prevention and control.

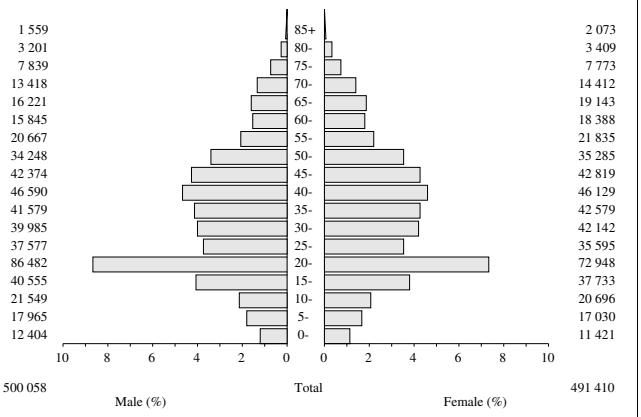
China, Harbin City, Nangang District

REGISTRATION AREA

The Nangang District Cancer Registry covers the permanent residents of Nangang District in the centre of the city of Harbin in China. Nangang is the largest of the nine districts of Harbin, and is bordered by the districts of Daoli, Daowai, Xiangfang, and Pingfang. The district's area is 182.87 km^2 (including an urban area of 60 km^2), which is one third of the total area of Harbin. The population is 1.3 million (90% Han Chinese). Due to the many colleges in Harbin City, there is a large temporary influx of students aged 20–24 years, who become short-term permanent residents.

REGISTRY STRUCTURE AND METHODS

The population-based registry began operation in 1997. It is located within the chronic disease division of the Nangang Center for Disease Control and Prevention (CDC), under the supervision of the Nangang Board of Health. The registry registers and reports all newly diagnosed malignant tumours and carcinoids of the central nervous system. A malignant tumour death reporting system and a general cause of death reporting system are also used as information sources. All health care professionals in Harbin are required to complete a notification card and submit it to the CDC whenever they diagnose a malignant tumour. They are also required to complete a death notification card in addition to each medical certificate of death. Follow-up is performed by family physicians at the community health service centre. Follow-up visits are currently limited to tumour death cases. The tumour notification cards are catalogued according to administrative area and disease type. After record linkage and duplicate elimination, cases are coded according to ICD-10. All registry tasks are now computerized.



USE OF THE DATA

Since its establishment in 1997, the registry has collected Nangang District malignant tumour incidence and mortality data for the period of 1990–2009. Registry data have been used for epidemiological research, cancer trend predictions, and research on cancer control policies and countermeasures.
